

# **2001 NATIONAL HOUSEHOLD TRAVEL SURVEY**

## **USER'S GUIDE**

**January 2004 (Version 3)  
(National Sample with Add-Ons)**

**June 2004**

## TABLE OF CONTENTS

CHAPTER I. INTRODUCTION .....	1-1
1-A. SURVEY SPONSORS.....	1-3
1-B. PURPOSE AND SCOPE OF THE SURVEY .....	1-3
1-B.1. DATA COLLECTED .....	1-3
1-B.2. USES OF NHTS.....	1-4
1-B.3. SCOPE - WHAT THE 2001 NHTS INCLUDES .....	1-5
1-B.4. SCOPE - WHAT IS NOT INCLUDED .....	1-6
1-C. SURVEY COVERAGE.....	1-7
1-C.1. WHO IS AN ELIGIBLE PARTICIPANT .....	1-7
1-C.2. WHEN WAS THE SURVEY CONDUCTED .....	1-8
1-C.3. WHAT TRIPS ARE INCLUDED.....	1-8
1-D. COMPARABILITY WITH EARLIER NPTS DATA .....	1-9
1-D.1. CHANGES OVER TIME IN THE NPTS/NHTS DATA SERIES ....	1-9
1-D.2. FACTORS AFFECTING COMPARABILITY TO PREVIOUS SURVEYS.....	1-14
1-E. TYPICAL NHTS HOUSEHOLD .....	1-15
CHAPTER 2. SURVEY CONTENT AND INTERVIEWS .....	2-1
2-A. INTERVIEW PROCESS OVERVIEW .....	2-1
2-A.1. OVERVIEW .....	2-1
2-A.2. THREE PHASES OF DATA COLLECTION .....	2-1
2-B. INTERVIEW PROCESS DETAIL .....	2-2
2-B.1. ADVANCE LETTER MAILING.....	2-2
2-B.2. HOUSEHOLD INTERVIEW.....	2-3
2-B.3. DIARY PACKAGE MAILING AND REMINDER CALL.....	2-5
2-B.4. PERSON INTERVIEW .....	2-6
2-B.5. ODOMETER READINGS.....	2-9
2-C. NHTS CORE DATA .....	2-11
2-C.1. HOUSEHOLD LEVEL CORE DATA .....	2-12
2-C.2. PERSON LEVEL CORE DATA.....	2-12
2-C.3. VEHICLE LEVEL CORE DATA.....	2-13
2-C.4. TRAVEL DAY CORE DATA.....	2-13
2-C.5. TRAVEL PERIOD CORE DATA.....	2-14
2-D. SURVEY CONTENT CHANGES IN 2001.....	2-15
2-D.1. THE NPTS AND ATS SURVEYS COMBINED.....	2-15
2-D.2. ALL HOUSEHOLD MEMBERS ELIGIBLE .....	2-15
2-D.3. CHANGES TO THE HOUSEHOLD INTERVIEW .....	2-16
2-D.4. CHANGES TO THE EMPLOYMENT QUESTIONS .....	2-16
2-D.5. INTERNET USE.....	2-16
2-D.6. TRAVEL DAY CHANGES.....	2-17
2-D.7. TRAVEL PERIOD CHANGES.....	2-18

**TABLE OF CONTENTS**  
(continued)

	2-D.8. MOST RECENT TRIP .....	2-18
2-E.	TYPICAL NHTS HOUSEHOLD .....	2-19
	2-E.1. TYPICAL NHTS HOUSEHOLD: HOUSEHOLD INTERVIEW....	2-19
	2-E.2. TYPICAL NHTS HOUSEHOLD: DIARY MAILING .....	2-20
	2-E.3. TYPICAL NHTS HOUSEHOLD: REMINDER CALL .....	2-20
	2-E.4. TYPICAL NHTS HOUSEHOLD: PERSON INTERVIEW .....	2-20
	2-E.5. TYPICAL NHTS HOUSEHOLD: FIRST ODOMETER READINGS .....	2-23
	2-E.6. TYPICAL NHTS HOUSEHOLD: SECOND ODOMETER READINGS .....	2-24
	2-E.7. TYPICAL NHTS HOUSEHOLD: THANK YOU POSTCARD .....	2-25
CHAPTER 3. SURVEY PROCEDURES AND METHODOLOGY .....		3-1
3-A.	OVERVIEW .....	3-1
	3-A.1. HOUSEHOLDS ELIGIBLE FOR THE NHTS .....	3-1
	3-A.2. HOW THE DATA WERE COLLECTED.....	3-2
	3-A.3. WHEN THE DATA ARE COLLECTED .....	3-2
	3-A.4. GEOGRAPHIC COVERAGE.....	3-3
3-B.	SAMPLE DESIGN AND SELECTION.....	3-3
	3-B.1. OVERVIEW .....	3-3
	3-B.2. SAMPLING FRAME .....	3-4
	3-B.3. SAMPLE SELECTION .....	3-4
3-C.	DATA COLLECTION PROCEDURES .....	3-5
	3-C.1. OVERVIEW.....	3-5
	3-C.2. INTERVIEWER TRAINING .....	3-5
	3-C.3. INTERVIEWER MONITORING .....	3-6
	3-C.4. CALLBACK PROCEDURES .....	3-6
	3-C.5. REFUSAL CONVERSION .....	3-6
	3-C.6. BILINGUAL INTERVIEWING .....	3-7
	3-C.7. CONFIDENTIALITY PROCEDURES .....	3-7
	3-C.8. ADVANCE LETTER AND CASH INCENTIVE TO HOUSEHOLDS .....	3-8
	3-C.9. TRAVEL DAY AND TRAVEL PERIOD ASSIGNMENT .....	3-8
	3-C.10. THE TRAVEL DIARY MAILING .....	3-9
	3-C.11. REMINDER CALL .....	3-10
	3-C.12. CALL-BACK PERIOD .....	3-10
	3-C.13. PROXY INTERVIEW PROCEDURES .....	3-11
	3-C.14. REDUCING RESPONDENT BURDEN .....	3-11
3-D.	DATA EDITING.....	3-13
	3-D.1. ONLINE EDITS .....	3-13
	3-D.2. UPDATING CATI DURING DATA COLLECTION .....	3-14

**TABLE OF CONTENTS**  
(continued)

	3-D.3. APPROACH TO POST INTERVIEW EDITING .....	3-16
	3-D.4. POST DATA COLLECTION EDITING .....	3-16
	3-D.4.A. EDIT FLAGS .....	3-17
	3-D.4.B. IMPUTATION FLAGS .....	3-18
	3-D.5. IMPUTING DATES FOR RECURRING TRAVEL PERIOD TRIPS .....	3-20
	3-D.6. TRIP REPORTING .....	3-21
	3-D.7. DATA MOVED FROM CATI TO DATA FILES SPECIFIED BY DOT .....	3-22
	3-D.8. USEABLE HOUSEHOLDS .....	3-22
	3-D.9. HUNDRED PERCENT HOUSEHOLDS .....	3-24
	3-D.10 EDITING THE DELIVERY DATASETS .....	3-24
3-E.	SURVEY METHOD AND PROCEDURE CHANGES .....	3-25
	3-E.1. 2001 NHTS CHANGES .....	3-25
3-F.	PROCEDURES TO ENSURE CONFIDENTIALITY .....	3-29
CHAPTER 4. SURVEY RESPONSE RATES .....		4-1
CHAPTER 5. WEIGHT CALCULATIONS .....		5-1
5-A.	HOUSEHOLD WEIGHTS .....	5-1
	5-A.1. INITIAL HOUSEHOLD WEIGHT .....	5-1
	5-A.2. USEABLE HOUSEHOLD WEIGHT .....	5-3
	5-A.3. HUNDRED PERCENT REPORTED HOUSEHOLD WEIGHT .....	5-4
5-B.	PERSON WEIGHTS .....	5-5
	5-B.1. USEABLE HOUSEHOLDS PERSON WEIGHT .....	5-5
	5-B.2. HUNDRED PERCENT REPORTED HOUSEHOLDS PERSON WEIGHT .....	5-5
5-C.	PERSON TRIP WEIGHTS FOR TRAVEL DAY DATA .....	5-6
5-D.	TRAVEL PERIOD WEIGHTS .....	5-6
	5-D.1. HOUSEHOLD TRIP WEIGHTS FOR TRAVEL PERIOD .....	5-6
	5-D.2. PERSON TRIP WEIGHTS FOR TRAVEL PERIOD .....	5-6
5-E.	DISTRIBUTION OF NUMBER OF TRAVEL PERIOD TRIPS .....	5-7
CHAPTER 6. DESCRIPTION OF DATA FILES .....		6-1
6-A.	STRUCTURE OF THE DATA FILES .....	6-1
	6-A.1. BASIC STRUCTURE .....	6-1
6-B.	RELATIONSHIP BETWEEN THE FOUR NHTS DATA FILES .....	6-3
	6-B.1. TYPICAL NHTS HOUSEHOLD .....	6-3
	6-B.2. WHEN IS A RECORD ON THE FILE .....	6-4
	6-B.3. HOUSEHOLD MEMBER VARIABLES .....	6-5

APPENDIX P.	DATA EDITING .....	P-1
APPENDIX Q.	TRACT AND BLOCK GROUP VARIABLES.....	Q-1

# CHAPTER 1. INTRODUCTION

## 2001 NHTS

This User's Guide provides details of the 2001 National Household Travel Survey (NHTS<sup>1</sup>). The survey provides information to assist transportation planners and policy makers who need comprehensive data on travel and transportation patterns in the United States. The 2001 NHTS updates information gathered in prior Nationwide Personal Transportation Surveys (NPTS) conducted in 1969, 1977, 1983, 1990, and 1995 and the American Travel Survey (ATS), conducted in 1977 and 1995.

## DATA FILES

Publicly available data files containing the data from the 2001 NHTS have the following general features:

- it is a microdata data set, which contains the record of each interview (with information deleted or suppressed that would identify the specific person or household),
- the January 2003 (Version 1) data are arranged in four hierarchical files (household, person, vehicle and travel day) to facilitate analysis,
- the Version 2 data are arranged in five hierarchical files. This version includes the travel period file,
- the January 2004 (Version 3) data are arranged in four hierarchical files. However, unlike the Version 1 and 2 data sets, this data set includes both data from the national sample and the nine add-on samples. Travel period data was not included, in the January 2004 release, but will be released separately by the Bureau of Transportation Statistics (BTS), and
- the data are available in the Statistical Analysis System (SAS), standard ASCII, and DBF format.

---

<sup>1</sup> See Appendix E for a list of all abbreviations used in this User's Guide.

## **USER'S GUIDE**

This guide includes descriptions of the survey procedures and methodology used for the 2001 NHTS, the questionnaire, the public use data files, and the weighting procedures for 2001 NHTS data. Appendices provide a dictionary of all variables in the data files, data file code books, Proc Content Listings, control totals, sample tables, glossary of NHTS terms and abbreviations, a copy of the 2001 NHTS questionnaire, and additional background information.

## **PUBLICATION SCHEDULE FOR THE NHTS DATASET**

Version 1 – Released in mid-January 2003. Contains data on the 26,038 households from the national survey and includes data on the households, persons, vehicles and daily (travel day) trips.

Version 2 – This dataset was provided to DOT in the summer of 2003. It supplements Version 1 with the long-trip (travel period) data for the national sample households, neighborhood characteristics data, odometer readings and fuel economy data for household vehicles. Like Version 1, Version 2 contains data on the 26,038 national households and represents the full scope of subject matter for the NHTS dataset.

Version 3 – Released in January, 2004. Supplements Version 2 with the data from approximately 40,000 add-on interviews, conducted in nine geographic areas (Baltimore, Des Moines, Hawaii, Kentucky, Lancaster PA, New York State, Oahu, Texas and Wisconsin). However, it is limited to four files (household, person, vehicle, travel day trips) as BTS has assumed responsibility for the release of the Travel Period and Most Recent Trip data files.

This User's Guide is intended to serve as the documentation for January 2004 release (Version 3) plus the Travel Period file

## **1-A. SURVEY SPONSORS**

The 2001 NHTS was conducted under the sponsorship of three agencies of the U.S. Department of Transportation:

Bureau of Transportation Statistics (BTS),  
Federal Highway Administration (FHWA), and  
National Highway Traffic Safety Administration (NHTSA).

BTS and FHWA together had the lead role in coordinating the survey.

## **1-B. PURPOSE AND SCOPE OF THE SURVEY**

### **1-B.1. DATA COLLECTED**

The NPTS and ATS have served as the nation's inventory of daily and long-distance travel. The NHTS combines and replaces these two surveys. Data is collected on daily trips taken in a 24-hour period, and includes:

- purpose of the trip (work, shopping, etc.),
- means of transportation used (car, bus, subway, walk, etc.),
- how long the trip took, i.e., travel time,
- time of day when the trip took place,
- day of week when the trip took place, and
- if a private vehicle trip:
  - number of people in the vehicle , i.e., vehicle occupancy,
  - driver characteristics (age, sex, worker status, education level, etc.), and
  - vehicle attributes (make, model, model year, amount of miles driven in a year).

These data are collected for:

- all trips,
- all modes,
- all purposes,
- all trip lengths, and
- all areas of the country, urban and rural.

In addition to the data above, the 2001 NHTS also collected additional data on trips to a destination 50 miles or more from home (long-distance travel) that started from home and ended at home during a four-week travel period. Data collected on long-distance trips included all the data mentioned above for daily trips with the exception of travel time and the time of day the trip took place. Data on the location of overnight stops and access/egress to an airport, train station, bus station or boat pier were also collected. If no long-distance trips were taken during the four-week period, a series of questions were asked regarding the most recent long-distance trip prior to that four-week travel period.

## **1-B.2. USES OF NHTS**

NHTS data are used to:

- quantify travel behavior,
- analyze changes in travel characteristics over time,
- relate travel behavior to the demographics of the traveler, and
- study the relationship of demographics and travel over time.

The NHTS data are used primarily for gaining a better understanding of travel behavior. The data enable DOT officials to assess program initiatives, review programs and policies, study current mobility issues, and plan for the future.

The NHTS is a tool in the urban transportation planning process; it provides data on personal travel behavior, trends in travel over time, trip generation rates, national data to use as a benchmark in reviewing local data, and data for various other planning and modeling applications.

The transportation research community, including academics, consultants and government, use the NHTS extensively to examine:

- travel behavior at the individual and household level,
- the characteristics of travel, such as trip chaining, use of the various modes, amount and purpose of travel by time of day & day of week, vehicle occupancy, and a host of other attributes,
- the relationship between demographics and travel, and
- the public's perceptions of the transportation system.

People in various fields outside of transportation use the NHTS data to connect the role of transportation with other aspects of our lives. Medical researchers use the data to determine crash exposure rates of drivers and passengers, including the elderly, who have heightened morbidity and mortality rates. Safety specialists study the accident risk of school-age children, particularly when they are travelling on their own by walking or biking. Social service agencies need to know more about how low-income households currently meet their travel needs.

### **1-B.3. SCOPE - WHAT THE 2001 NHTS INCLUDES**

The 2001 NHTS data set includes<sup>2</sup>, but is not limited to:

- household data on the relationship of household members, education level, income, housing characteristics, and other demographic information;

---

<sup>2</sup> The January, 2004 published data set does not include long distance data. BTS has assumed responsibility for publishing this data set.

- information on each household vehicle, including year, make, model, and estimates of annual miles traveled;
- data about drivers, including information on travel as part of work;
- data about one-way trips taken during a designated 24-hour period (the household's travel day) including the time the trip began and ended, length of the trip, composition of the travel party, mode of transportation, purpose of the trip, and the specific vehicle used (if a household vehicle);
- data describing round-trips taken during a four-week period (the household's travel period) where the farthest point of the trip was at least 50 miles from home, including the farthest destination, access and egress stops and overnight stays on the way to and from the farthest destination, mode, purpose, and travel party information;
- if no long-distance trips were made during the four-week travel period, data on the most recent long-distance trip by any mode and the most recent long-distance train trip;
- information to describe characteristics of the geographic area in which the sample household and workplace of sample persons are located;
- data on telecommuting;
- public perceptions of the transportation system;
- data on Internet usage; and
- the typical number of transit, walk and bike trips made over a period longer than the 24-hour travel day.

#### **1-B.4. SCOPE - WHAT IS NOT INCLUDED**

In the past there have been many requests for data that are closely related to, but are not available in the survey. Examples of the most common requests for data that are not included in NHTS are:

- information on costs of travel,
- information about specific travel routes or types of roads used,
- how travel of the sampled household changes over time, [Note: The NHTS is a cross-sectional survey, which means that different households

are selected for the sample each time it is conducted. The NHTS is not currently a longitudinal survey, which would involve tracking the same sample households over time.]

- information that would identify the exact household or workplace location. This information is collected but not published to protect the confidentiality of respondents, and
- the traveler's reason for selecting a specific mode of travel over another mode.

## **1-C. SURVEY COVERAGE**

### **1-C.1. WHO IS AN ELIGIBLE PARTICIPANT**

The NHTS is a survey of the civilian, non-institutionalized population of the United States. Sampling is done by creating a random-digit dialing (RDD) list of telephone numbers. An eligible household excludes telephones in motels, hotels, group quarters, such as nursing homes, prisons, barracks, convents or monasteries and any living quarters with 10 or more unrelated roommates.

Telephones in dorm rooms, fraternity and sorority houses were eligible provided the residence had less than 11 household members. Therefore, students who normally reside at school but were living at home for the summer were not considered household members at their parent's home.

Household members included people who think of the sampled household as their primary place of residence. It included persons who usually stay in the household but were temporarily away on business, vacation, or in a hospital. It did not include people just visiting, such as a college student who normally has been living away at school.

### **1.C.2. WHEN WAS THE SURVEY CONDUCTED**

The 2001 NHTS for the national and New York add-on was conducted over a period from March 2001 through May 2002. The first telephone call to recruit a household in the national sample was made on March 19, 2001. Travel days were assigned for all seven days of the week, including all holidays. The first travel day assigned was March 29, 2001. The last travel day assigned was May 4, 2002. The assigned travel period for long-distance trip reporting was the four-week period ending with the travel day. So, the first travel period assigned was March 2 through March 29, 2001, and the last travel period assigned was April 7 through May 4, 2002.

Data collection for the 2001 Wisconsin add-on was conducted over a period from May 1, 2001 through May 6, 2002. The first telephone call to recruit a household was made on May 1, 2001. Travel days were assigned for all seven days of the week, including all holidays. The first travel day assigned was May 11, 2001. The last travel day assigned was May 3, 2002. The assigned travel period for long-distance trip reporting was the four-week period ending with the travel day. So, the last travel period assigned was April 6 through May 3, 2002.

Data collection for 2001 Baltimore, Des Moines, Hawaii, Kentucky, Lancaster PA, Oahu, and Texas add-ons were conducted between May 31, 2001 and July 5, 2002. The first household interview was initiated on May 31, 2001. The first travel day assigned was June 12, 2001. The last travel day assigned was June 28, 2002. Long-distance data was collected only for the Texas add-on.

### **1.C.3. WHAT TRIPS ARE INCLUDED**

For the travel day portion of the survey, all trips reported by eligible household members in eligible households in the U.S. were recorded. Household members who were travelling outside the U.S. for the entire travel day were not asked to report their daily travel. However, households in the national sample, New York, Texas and Wisconsin add-ons were required to report their long-distance travel.

The designated 24-hour travel day starts at 4:00 am of the day assigned and continues until 3:59 am of the following day. On a typical day, 4 am represents the time

when the fewest number of people are in transit, thus allowing collection of more coherent data on trips.

For travel period, each household in the national sample, New York, and Wisconsin add-ons was provided a map showing a circle of 50 miles in radius around the household's home. Households were asked to include all trips where the farthest destination was at least 50 miles away from their homes (i.e., trips outside the circle) that ended during the travel period.

#### **1-D. COMPARABILITY WITH EARLIER NPTS DATA**

The 2001 NHTS continues the series of household travel surveys begun by the Department of Transportation in 1969 to measure every-day and long distance travel in the United States. The survey has evolved considerably over the years in both scope and methodology. This section of the User's Guide presents a summary of the characteristics of each of the six NPTS/NHTS surveys from 1969 through 2001. Exhibit 1-1 tabulates the key changes in the survey over time and includes information on the 1995 ATS in addition to the six NPTS/NHTS surveys.

##### **1-D.1. CHANGES OVER TIME IN THE NPTS/NHTS DATA SERIES**

**1969 and 1977** – These surveys were similar in that the sampling frame was clustered (Primary Sampling Units) from retired Census surveys. Both were conducted as face-to-face home interviews using a pencil and paper questionnaire administered by field staff of the Census Bureau. The sample sizes were 15,000 and 18,000 households respectively, so both were sufficient to give a national picture of household travel.

## Exhibit 1-1. Changes Over Time in the NPTS/NHTS Data Series

Sample Year	Sample Size (households)	Sample Selection	Interview Method(s)	Number of Contacts	Contractor	Travel Day Data (memory/diary)	Travel Period Definition	Unique Attributes	Response Rate	Add-Ons
1969	15,000	235 PSU's (primary sampling units) – outgoing panels of Census' Quarterly Housing Survey	in-home interviews; some telephone followup	one	Bureau of Census	from memory	all overnight trips ending during the 7 days before the travel day	- shortest NPTS questionnaire - asked about shopping trips to the main business district and typical school trips	Not available	none
1977	18,000	376 PSU's – outgoing panels of Census' Current Population Survey	in-home interviews; some telephone followup	one	Bureau of Census	from memory	all trips of 75 miles or more with a return home during the 14 days preceding travel day	- NPTS and the NTS (National Travel Survey) shared a common sample - mapping of motor vehicle trips and allocation of miles to urban and rural travel - lengthy and detailed questionnaire, including stops on long-distance trips	85.3% (21,033 eligible household units, 17,949 responding)	none
1983	6,500	376 PSU's – outgoing panels of Census' Current Population Survey	in-home interviews; some telephone followup	one	Bureau of Census	from memory	all trips of 75 miles or more with a return home during the 14 days preceding and including travel day	- more vehicle characteristics collected - designed to collect travel period and travel day trips occurring on the same day - relatively small national sample created comparability issues in the series	93.3% (6,900 eligible household units 6,438 responding)	none
1990	22,317 (18,000 national and 4,300 add-ons)	- list-assisted sample of telephone numbers formed a Random Digit Dialing (RDD) sample - sample was stratified by 34 geographic units	telephone interviews	one	Research Triangle Institute, Research Triangle Park, North Carolina	from memory	all trips of 75 miles or more with a return home during the 14 days preceding and including travel day	- first time that the survey conducted exclusively by phone - first unclustered sample design - data collected on most recent traffic accident, if within the past 5 years - first time for add-ons	73.1% (30,529 eligible and presumed eligible household units, 22,317 completing)	New York State Connecticut Indianapolis MPO

**Exhibit 1-1. Changes Over Time in the NPTS/NHTS Data Series (continued)**

Sample Year	Sample Size (households)	Sample Selection	Interview Method(s)	Number of Contacts	Contractor	Travel Day Data (memory/ diary)	Travel Period Definition	Unique Attributes	Response Rate	Add-Ons
1995 NPTS	42,033 (21,000 national and 21,033 add-ons)	- list-assisted sample of telephone numbers formed a Random Digit Dialing (RDD) sample - sample was stratified by 70 geographic units	telephone interviews	two – one interview at the household level, one for each person in the household	Research Triangle Institute, Research Triangle Park, North Carolina	travel diary used	all trips of 75 miles or more with a return home during the 14 days preceding and including the travel day	- first time for a 2-stage survey using a travel diary - trip rates increased considerably because of the travel diary - completed household definition changed to 50% or more of household adults - household rostering of trips (ability to confirm trips previously reported by another household member) - first time cash incentives were used - first time odometer readings were collected	37.2% (112,960 eligible and presumed eligible residential telephone numbers, 42,033 household completing)	New York State Commonwealth of Massachusetts Oklahoma City, OK Tulsa, OK
1995 ATS	80,000	PSU's – outgoing panels of Census' Current Population Survey	telephone and personal visit	four-panel survey with 4 waves occurring 3 months apart	Bureau of Census	travel diary used	all trips of 100 miles or more during a 1 year period	- panel design of 4 wave interviews over a 1 year data collection period - trips of 100 miles or more, excluding commute trips	85% (68,000 households)	None
2001	69,817 useable households (26,038 national and 43,779 add-ons)	list-assisted sample of telephone numbers formed a Random Digit Dialing (RDD) sample	telephone interviews	two – one interview at the household level, one for each person in the household	Westat Rockville, MD (completed 54,937 interviews in the National sample and 2 add-ons);  Morpac, Farmington Hills, MI (completed 14,880 interviews in 7 add-ons)	travel diary used	all trips of 50 miles or more with a return home during the 28 days preceding and including travel day	- first time the long trip survey (American Travel Survey) was combined with the daily trip survey (NPTS) - threshold for long trips was lowered to 50 miles to collect more trips in the previously ignored 50-75 mile range - if no long trips taken during travel period, most recent trip of 50 miles or more was collected - walking trips increased considerably because of multiple prompts in the questionnaire - cash incentives used in both the pre-interview letter and with the travel diary mailing - multiple data collection methods for odometer readings	28.6% (217,063 eligible and presumed eligible residential telephone numbers in full sample, 69,817 households completing)	Baltimore, MPO Des Moines, MPO Hawaii Kentucky (4 counties) Lancaster PA, MPO New York State Oahu (Honolulu MPO) Texas Wisconsin

The 1969 questionnaire was very short and to the point, while the 1977 questionnaire was long and detailed. Much of the detail added in 1977 was information on long trips (travel period trips). The focus on long trips in 1977 was further reinforced by the fact that a part of the NPTS sample was also interviewed for the National Travel Survey (NTS.) The NTS was a survey of long-distance trips (100+ miles) taken over the course of a full year. Note that 1977 marked the last national long-distance trip survey until 1995, when BTS (the Bureau of Transportation Statistics) resurrected this data series as the American Travel Survey.

The other major difference between the 1969 and 1977 surveys was that the focus on *auto* travel in 1969 was broadened to *vehicle* travel by 1977, reflecting the greater mix of vehicle types in the household-based fleet.

**1983** – Like the 1969 and 1977, the 1983 survey was conducted as a face-to-face interview by Census Bureau field staff, using a retired PSU-based sample from the Current Population Survey. However, either because of the smaller sample size of 6,500 households or the economic conditions during the survey period, the 1983 data is acknowledged as an anomaly in the NPTS series, with trip and travel data believed to be too low. Another issue inherent to the 1983 dataset is that, given the low sample size, each Census field interviewer only conducted 2-3 NPTS interviews a month. It seemed that this was too low a threshold to maintain proficiency with a complex questionnaire like NPTS.

All three of the Census-administered surveys had used a four-day recall window beyond travel day. That is, the person-level interview must be completed within 4 days after travel day for the interview to be included.

**1990** – The 1990 NPTS represented a switch to a private survey research firm, Research Triangle Institute, and to a telephone sample. The interviews were conducted using CATI (Computer-Assisted Telephone Interviewing) which allows for some on-line editing as the data is collected. A non-clustered random-digit dialing sample was used, which could better represent travel throughout the country. (Clustered samples are problematic for household travel surveys because the nature of some mode choices is highly dependent on very small geographic areas. For example, people who live within a half-mile of public transit will use it considerably more than

people who live 2 miles away from transit. Thus, the specific location of the clusters can determine the types of travel collected.)

Because it is more difficult to reach individual respondents by telephone, the recall window was expanded to 6 days beyond travel day.

While switching to a telephone survey resolved the problems with sample clustering and sample size, the 1990 NPTS trip rates (expressed as daily person trips per household) were still well-below those obtained by Metropolitan Planning Organizations in their household travel surveys. This had been a problem throughout the data series, and it would be solved in the 1995 survey.

**1995** – A major change in the 1995 survey was the use of a travel diary for collecting daily trips. While the travel diary corrected the previously-described problem of trip rates, it necessitated a switch to a two-stage data collection.

The two-stage data collection, combined with the increase in survey burden and the increase in telemarketing over time, resulted in a much lower response rate than previously obtained in the NPTS.

Another significant change in the 1995 survey was changing the standard for a household to be included in the dataset. The previous requirement was that one or more household members had to complete the person interview for the household to be considered complete. In 1995, this was changed to 50% or more of the household adults (18+) had to be interviewed for the household to be included in the dataset.

**2001 NHTS** – The 2001 survey represented a combined survey of the NPTS and the ATS (American Travel Survey). The ATS, which had been conducted in 1995 by BTS, was a survey of trips of 100 miles or more taken over the course of a calendar year. There were problems in trying to use the 1995 NPTS and the 1995 ATS together to form a picture of total household travel by the American public. The combined survey approach for the 2001 NHTS was designed to give one data source for the full continuum of person travel.

In addition to a combined survey, the threshold for longer trips was lowered to 50 miles or more, to obtain a better sample of those often overlooked 50-100 mile trips.

For the first time in the NPTS series, travel was collected for household members 0-4 years old. All previous surveys had collected travel only from household members age 5 and older, on the dated assumption that those 0-4 only made trips with other household members. However, this ignored trips of this young group made with day care providers, as part of a preschool activity, or just with non-household members.

Great care was taken in the 2001 NHTS to resolve some of the response rate issues that surfaced in the 1995 survey. Westat, the survey contractor, initiated a number of successful actions to stop the decline in response rates.

More detail on each of the surveys in the NPTS/NHTS series is contained in Appendix O.

In addition to changes in the survey design and administration, a host of real world factors affected the 2001 NHTS, as described in the following section.

#### **1-D.2. FACTORS AFFECTING COMPARABILITY TO PREVIOUS SURVEYS**

Certain factors, such as the state of the economy and the price of oil are known to have significant effects on how, when, and the amount that people travel. Variations in these factors are expected and are often accounted for in travel trend analysis. However, during the 2001 NHTS data collection period, which was from March 2001 through May 2002, several extraordinary events occurred that undoubtedly affected travel in the United States. The first occurred on September 11, 2001, when terrorists attacked the World Trade Center Towers in New York and the Pentagon near Washington, D.C. using four commandeered commercial aircraft. The attacks, and the intense security measures imposed on commercial air travel and major transportation facilities of all types that followed, severely disrupted travel in the United States for months, changing the amount and modes of travel during that period. The second series of events occurred during the period from mid-September through mid-November 2001, when letters containing anthrax were sent to various recipients in Florida, New

York, and the District of Columbia. This resulted in a number of deaths and widespread concern regarding public health and the safety of U.S. mail, and the public's suspicion and fear of receiving unanticipated mail packages was greatly heightened. Although the impact of this on travel is yet to be determined, it may have affected NHTS response rates, since there was a mail component of the survey.

#### **1-E. TYPICAL NHTS HOUSEHOLD**

To illustrate key NHTS concepts, an example may be helpful. We introduce at this point a hypothetical sample household consisting of the following four persons:

##### **Typical NHTS Household:**

Amy and Keith live in a metropolitan area with their two children Lucy and Ben. When Keith picked up their mail in early April 2001, he noticed an envelope from the US Department of Transportation. On opening the envelope, he found that it contained a letter from Norman Y. Mineta, the Secretary of Transportation, a five-dollar cash incentive, and a brochure describing the NHTS. The letter informed Keith that their home telephone number had been selected in the sample for the National Household Travel Survey, and that they would be receiving a telephone call from an interviewer. Several days later, the household was contacted by telephone by an NHTS interviewer and participated in the survey.

We will refer back to this typical NHTS household from time to time in later sections of this User's Guide, to illustrate aspects of the survey procedures and methodology.

## CHAPTER 2. SURVEY CONTENT AND INTERVIEWS

### 2-A. INTERVIEW PROCESS OVERVIEW

#### 2-A.1. OVERVIEW

An understanding of the data collection for the NHTS is essential to the proper use and interpretation of the data. Staff from BTS and FHWA occasionally monitored the data collection interviews for the national sample, New York and Wisconsin add-ons from Westat's telephone monitoring center in Rockville, Maryland. They monitored interviews for the Baltimore, Des Moines, Hawaii, Kentucky, Lancaster PA, Oahu and Texas add-ons on-site from Morpace's telephone monitoring center in Sterling Heights, Michigan and remotely from DOT by connecting to Morpace's CATI system. Everyone who had the experience of monitoring the interviews gained a better understanding of the survey data. An audio recording (CD) of a variety of simulated interviews is also available as part of the public use data package.

For purposes of this User's Guide we have attempted to give the reader a clear understanding of the interview process by using the Typical NHTS Household example. Basic background on the interview process, as contained in the next few sections, will aid the reader in understanding the Typical Household's involvement in the survey.

Data collection for the national survey and New York and Wisconsin add-ons was conducted by Westat. Data collection for the Baltimore, Des Moines, Hawaii, Kentucky, Lancaster PA, Oahu and Texas add-ons was conducted by Morpace International. Key differences in methodology between firms or jurisdictions are highlighted in the sections that follow.

#### 2-A.2. THREE PHASES OF DATA COLLECTION

The NHTS data collection consisted of three main phases:

- **Household Interview** - collected information about the household, the household members, vehicles owned or available to the household, and

the mailing address for the travel diaries. It was conducted once per household.

- **Person Interview** - collected the travel day data, the travel period data, most recent long-distance trip data, information about worker status, the workplace and the typical trip to work, data on occasional working from home, customer satisfaction with the transportation system, and data on Internet use. A person interview was attempted for each household member, with an adult proxy required for all household members less than 14 years old. A proxy was requested for household members 14 and 15 years old, but they could respond for themselves if approval was obtained from an adult household member. For the household to be included in the final data set, interviews had to be completed with at least half of the household adults (defined as persons 18 years and older). For households with all persons under age 18 (emancipated households), the household was included in the public use dataset if interviews were completed with all household members. Travel period data was collected only for households in the national sample, New York, Texas, and Wisconsin add-ons.
- **Odometer Readings** – for the national sample, New York and Wisconsin add-ons were collected for each household vehicle at two points in time. The first was at or around the time of the person interviews. The second was at least 2 months later. The dates of each reading were recorded to facilitate the estimation of annual mileage. Odometer readings were not collected from the seven Morpace add-ons.

## **2-B. INTERVIEW PROCESS DETAIL**

### **2-B.1. ADVANCE LETTER MAILING**

Once a sample telephone number was selected, an advance letter was mailed to the household if a mailing address for that telephone number was available from vendors that specialize in providing addresses for both listed and unlisted telephone numbers. The letter was signed by the Secretary of Transportation, Norman Y. Mineta. The pre-household interview transmittal package included the letter, a five-dollar cash incentive for the national and New York add-ons and a two-dollar cash incentive for the Wisconsin add-on, and a brochure introducing the survey.

As in the Wisconsin add-on, the advance letter mailed to households in the Baltimore, Oahu, Hawaii, Kentucky, Lancaster County, Des Moines, and Texas add-ons contained an incentive of two-dollars to promote participation in the survey. These letters were typically signed by a dignitary for the add-on region:

- Baltimore: Paul Farragut, Executive Director, Baltimore Metropolitan Council
- Oahu: Duke Bainum, Councilmember, OMPO Chair for the first one-half of data collection followed by Gordon Lum, Executive Director, Oahu Metropolitan Planning Organization for the second one-half of data collection.
- Hawaii: Brian Minaai, Director, State of Hawaii Department of Transportation
- Lancaster County: Paul Thibault, Chairman; Howard “Pete” Shaub, Vice-Chairman; Ron Ford, Commissioner; Lancaster County Office of the County Commissioners
- Kentucky: Terri Giltner, Executive Director, Office of Public Affairs (first one-half of data collection) Mark Pfeiffer, Executive Director, Office of Public Affairs (second one-half of data collection)
- Texas: Tim Juarez, Metropolitan Planning Supervisor, Texas Department of Transportation
- Des Moines: Loretta Sieman, MPO Executive Committee, City of West Des Moines; Geri Huser, MPO Executive Committee, City of Altoona; Carl Metzger, MPO Executive Committee, City of Ankeny; Christine Hensley, MPO Executive Committee, City of Des Moines; Jim Lane, MPO Executive Committee, City of Norwalk; John Ruan III, MPO Executive Committee, City of Des Moines; Alice Wicker, Dallas County Supervisor; Cy McDonald, Madison County Supervisor; Angela Connolly, Polk County Supervisor; and E. David Mineart, Warren County Supervisor

The letters and brochure are shown in Appendix N, NHTS Field Documents.

## **2-B.2. HOUSEHOLD INTERVIEW**

About a week after the advance letter mailing, an interviewer made the first telephone call to the household and attempted to speak with an adult household member. This household member was administered the Household Interview. The first portion of the interview included screening questions to determine if the telephone number was residential. Eligible residential households were administered the complete household questionnaire. The household questionnaire, contained in

Sections A through D of the NHTS questionnaire, is included in this User's Guide as Appendix M, 2001 NHTS Questionnaire.

Westat completed household interviews with 77,374 households in the national sample, New York and Wisconsin add-ons. Morpace completed 29,224 household interviews in Baltimore, Oahu, Hawaii, Kentucky, Lancaster County, Des Moines, and Texas. However, the public use dataset for these areas contains just the 69,817 households that were considered complete or useable both at the household and person level. These included 54,937 households in the national, New York and Wisconsin samples and 14,880 in the seven Morpace add-ons.

A household in the published dataset was deemed complete or useable if at least half of the adult members (18 years or older) completed a person interview. About 1.9 percent of the useable households in the national and New York add-ons completed the interview in Spanish. This percentage for the Wisconsin add-on was lower at 0.6 percent.

For the add-ons conducted by Morpace, only the Texas respondents had the option of completing the household interview in Spanish. Out of 8,465 Texas households interviewed by Morpace, 57 households (0.7 percent) completed the household interview in Spanish.

Exhibit 2-1 describes the Household Interview.

**Exhibit 2-1. Household Interview Contents**

<b>Data Collected</b>	<ul style="list-style-type: none"> <li>• Information to determine whether the sampled telephone number is for home use, home and business use, or only for business use.</li> <li>• Characteristics of the household members, vehicles, and address for mailing the travel diaries.</li> </ul>
<b>Who is contacted</b>	The respondent for the household interview is any member of the household who is at least 18 years old.
<b>When collected</b>	<ul style="list-style-type: none"> <li>• The first telephone contact with a household with a mailing address was made about a week after the household was mailed the pre-household interview package. The first contact with a household with no mailing address was made a few days after the telephone number was released to the interviewers.</li> <li>• The timing of follow-up contacts with a household was dependent on the outcome of prior contacts with that household.</li> </ul>
<b>Why collected</b>	<ul style="list-style-type: none"> <li>• To ensure the sampled number is residential, not group quarters, business, etc.</li> <li>• To introduce the survey, obtain household-level and address information, and provide the household with its assigned travel date.</li> </ul>
<b>How collected</b>	The Household Interview was conducted by telephone. For the national sample the interview took an average of 7.8 minutes to administer. The interview in the New York add-on took 7.7 minutes whereas for the Wisconsin add-on the average was just 7.4 minutes. The interview for the seven Morpace households averaged 8 minutes.

**2-B.3. DIARY PACKAGE MAILING AND REMINDER CALL**

Each household that completed a household interview was sent a diary package. The package was sent via Priority Mail soon after the household interview was completed. The mailing was timed to reach the household a few days prior to its assigned travel day. Each diary package (see Appendix N) Westat mailed contained:

- a letter from the U.S. DOT,

- a brochure describing the survey,
- an envelope with a diary and a two-dollar cash incentive for each household member,
- a reminder card showing the assigned travel day,
- a map demarcating places over 50 miles from the household, and
- an odometer mileage form listing the household's vehicles.

The seven Morpace add-ons received all the above materials with the exception of the travel period map and the odometer reading listing.

The next contact with the household was on the day before the household's travel day. An NHTS interviewer called to find out if the household had received the diary package and had any questions about the survey. The person answering the telephone was asked to remind household members to complete their travel diaries on the following day. If the interviewer was unable to reach the household, the interviewer left an answering machine message and provided a toll-free number that household members could use if they had any questions.

#### **2-B.4. PERSON INTERVIEW**

Calls for person interviews began the day following the travel day and continued until all household members had completed a person interview, or up to a maximum of six days after the travel day, whichever date came first. A six-day limit was used because recall would be too difficult beyond that time.

Proxy interviews were requested for all household members under age 16. However, interviewers could directly interview household members age 14 and 15 years if asked to do so by an adult household member. Proxy interviews for adults were allowed if:

- the subject was not capable of being interviewed because of an impairment or a language barrier;

- the interviewer was told that this subject would not be available for the entire six-day recall period;
- the interviewer was told that this subject would never participate, and the proxy was knowledgeable about the subject's travel on the assigned travel day; or
- the interviewers attempted to reach the subject for the first three days of the six-day call-back period, and were not successful.

In all cases of proxy interviews, the use of the subject's travel diary was strongly encouraged.

The total number of person interviews completed in the 69,817 useable households in the full sample (national and nine add-ons) was 160,758 of which 124,477 were for persons age 16 or older. Overall, 67,053 interviews (or 41.7 percent) were completed by proxy. Among those, 34,786 were for persons younger than 16, for whom a proxy interview was either preferred or required. The remaining 32,267 proxy interviews were for persons age 16 and older. Thus, 92,210 of the 124,477 (74.1 percent) interviews for respondents age 16 and older were completed by the subject and not by proxy.

The overall average time to complete a person interview in the national sample was 14.8 minutes. The average for the New York and Wisconsin add-ons were higher at 17.3 and 16.9 minutes respectively. The average time to complete a person interview by proxy in the national sample was 7.7 minutes, whereas the average time to complete a person interview with the subject was 19.5 minutes. For the New York and Wisconsin add-ons the average proxy interview took 9.2 and 8.7 minutes to complete. Whereas the interview with the subject took 22.7 minutes in the New York add-on and 22.0 minutes in the Wisconsin add-on.

The large difference in administration times between proxy and self-interviews is because the majority of proxy interviews were for non-adult subjects. These individuals usually made trips with other household members. Therefore, trip detail for these individuals was collected during the interview with the adult household member. In addition, non-adults were only asked about their travel and did not have to answer questions related to employment, Internet use, vehicle use, demographic information, etc.

The average time to complete a person interview for the seven Morpace add-ons was 9.8 minutes. This time was lower than the average for the national, New York and Wisconsin samples because six of the seven Morpace add-ons did not include the travel period portion of the interview. Travel period information was only collected for the Texas add-on. The average time to complete a person interview for the six add-ons without the travel period section was 9.0 minutes, while Texas averaged 11.7 minutes overall.

About 1.9 percent of the person interviews in the national and New York add-on samples were completed in Spanish. For the Wisconsin add-on just 0.7 percent were completed in Spanish. For the national sample, the average time to complete a person interview in Spanish was 15.5 minutes. For the New York add-on the average Spanish interview took 20.0 minutes to complete. For the Wisconsin add-on the average was 18.2 minutes. For the Texas add-on the average Spanish interview took 15.0 minutes to complete. Proxy rules were relaxed for households where no adults spoke English or Spanish, to encourage survey participation through a household member that was an English-speaking teenager. Exhibit 2-2 describes the person interview.

**Exhibit 2-2. Person Interview Content by Age of Household Member**

	<b>Age 16 and older</b>	<b>Under 16 years of age</b>
<b>Data collected</b>	Employment information Usual travel to work Travel day trip information Travel period trip information Most recent trip information Customer satisfaction Primary driver information Internet use Demographic data (if 18 or older) 1 <sup>st</sup> odometer reading (if 18 or older)	Travel day trip information Travel period trip information Most recent trip information

<b>How collected</b>	Travel diaries mailed Person interview by telephone	Travel diaries mailed Person interview by telephone

**2-B.5. ODOMETER READINGS**

The third portion of the NHTS survey involves collecting odometer readings twice for each of the household’s vehicles that were enumerated during the household interview. Appendix N, NHTS Field Documents, displays the odometer forms Westat used to collect readings. Odometer readings were not collected for the seven Morpace add-ons.

**First Odometer Reading.** An odometer mileage form listing the make, model and year of each vehicle and requesting odometer readings and the dates of the readings was mailed with the travel diaries. Households were instructed to record the readings and provide them during the person interview.

Households that did not provide readings during the person interview but were useable households (where at least half of the adults in the household had completed a person interview) were contacted after the six-day window for completion of person interviews had expired. A Respondent Information Sheet was printed showing vehicle information. An interviewer then made five additional attempts to collect the first readings from the household.

**Second Odometer Reading.** Westat collected these readings via five different modes. Useable households that provided an odometer reading for at least one vehicle in the household were sent a request for a second reading. This request was sent at least two months after the collection of the first odometer readings. The transmittal package included a letter showing each vehicle, its first reading and the reading date, and a postage-paid return envelope. Households were provided four options - they could use the return envelope to mail their second readings, fax the readings, call the study toll-free number and provide the readings by telephone, or use the Internet to record the readings. After a reasonable interval an interviewer contacted households that failed to provide a reading via the four options. Interviewers used a Respondent Information Sheet (see Appendix N, NHTS Field Documents) to record the second readings.

Some households responded via multiple modes. Therefore, it is difficult to do an accurate analysis on the frequency of use of the different options. However, a rough analysis showed that the majority of households in the national sample, New York and Wisconsin add-ons (52 percent) used the postage-paid return envelope to send in their second readings. The next largest group of responses (44 percent) was obtained through outgoing telephone calls by interviewers using a Respondent Information Sheet. About two percent of responses were received via the Internet and one percent each by facsimile and incoming calls to the study's toll-free telephone number. Exhibit 2-3 that follows describes the odometer reading contacts.

**Exhibit 2-3. Contents of the Odometer Reading Contacts**

	<b>First Odometer Reading</b>	<b>Second Odometer Reading</b>

**2-C. NHTS CORE DATA**

There is a group of data that is considered “core” NHTS data, and it is largely composed of the items that have been collected in all five NPTS surveys to date. It is very likely that this core data will be included in future NHTS efforts. The data items that are considered core and their item numbers on the 2001 NHTS questionnaire are:

### **2-C.1. HOUSEHOLD LEVEL CORE DATA**

These data are collected for each household that completed a household interview.

1. Household size - item C3 and verified in C8
2. Household composition - item C8 and verified at the start of the person interview
3. Age of each household member- item C8
4. Sex of each household member- item C8
5. Relationship of each household member to the household respondent - item C8
6. Worker status of each household member- items C8 and E3 through E5
7. Driver status of each household member - items C8, C13 and G49
8. Number of vehicles - item B1 and verified in B2
9. Race & Hispanic status of household respondent - items C6 and C7
10. Household location - items D4 through D9, M11 and M12
11. Income - items M13 through M32
12. Number of telephones - items C15 and C16

### **2-C.2. PERSON LEVEL CORE DATA**

These data are collected for each household member that completed a person interview.

1. Education level - item M7
2. Worker status - items C8 and E3 through E5
3. If worker: employer information - items E10 through E13
4. If worker: typical work trip - items E14 through E20

5. Driver status - items C8, C13 and G49
6. If driver: annual miles driven - items L5 through L5B
7. If worker and driver: drive as part of work - items E8 and E9

### **2-C.3. VEHICLE LEVEL CORE DATA**

These data are collected for each household vehicle owned, leased or available for regular use by household members in households that completed the household interview. The information was collected during the household interview and person interviews.

1. Make - item B2 and verified in L7 and during the collection of odometer readings
2. Model - item B2 and verified in L7 and during the collection of odometer readings
3. Model year - item B2 and verified in L7 and during the collection of odometer readings
4. Months vehicle owned, if less than 12 - L8
5. Annual miles driven - items L9 through L10B
6. Primary driver - item C12
7. Odometer readings - item N2 and after the person interview

### **2-C.4. TRAVEL DAY CORE DATA**

These data are collected for each trip each household member made on the household's assigned travel day. The information was collected during the person interview.

1. Time trip began - item G16
2. Trip purpose - items G25 through G26E
3. Distance to destination - item G40

4. Time trip took - item G42
5. Main mode of transportation - item G34
6. If public transit was used: access and egress modes used - items G35 through G39
7. Household vehicle used - item G30
8. If household vehicle used: which vehicle - item G31
9. If private vehicle trip: did a household member drive - item G48
10. If household member drove: which household member - item G49
11. If someone else on trip: any household members - item G44
12. If household members on trip: which household members - item G45
13. If someone else on trip: any non-household members - item G46
14. If non-household members on trip: how many - item G47

The answers to this series of core questions about each trip taken by the members of the household on their travel day provide the most sought after and most used data from the NHTS and all other household travel surveys.

#### **2-C.5. TRAVEL PERIOD CORE DATA**

These data are collected for each long-distance trip that has a farthest destination of at least 50 miles from home that ended during the four-week travel period.

1. Trip purpose - item I13
2. Main means of transportation - item I5 and I15
3. Farthest destination, trip duration and whether the trip was a recurring trip - item H1
4. Who else on trip - items I2 through I4
5. Access and egress modes - items I8 and I11

6. Overnight stops, transportation mode and stop purpose - items J1 through J3

## **2-D. SURVEY CONTENT CHANGES IN 2001**

The 2001 NHTS saw several changes to both the content and organization of the NHTS questionnaires. As discussed in the previous section, DOT attempted to keep the core questions in the 2001 survey identical to previous surveys. However, some changes were made to improve data quality even to core questions. The key changes in 2001 NHTS compared to the 1995 NPTS survey are described in this section.

### **2-D.1. THE NPTS AND ATS SURVEYS COMBINED**

The 2001 NHTS is a combination of the NPTS (daily travel) and the ATS (long-distance travel) surveys. Sampled households were asked to provide both all travel information for an assigned travel day and long trip information for a four-week period ending with the travel day. This combined design was implemented because it could provide a key link between daily travel and long-distance travel behavior by the same survey participants. The 2000 pretest showed that a combined design provided trip and response rates that were comparable to rates obtained when the surveys were conducted separately. In addition, the combined design was more cost-effective and reduced redundancy.

### **2-D.2. ALL HOUSEHOLD MEMBERS ELIGIBLE**

In recent NPTS surveys, travel information was only collected from household members five years and older. For the 2001 NHTS, all household members were eligible for a person interview. This change will enable the user to get a more complete picture of household trip making as it rosters trips taken by household members younger than five years that were made with non-household members.

### **2-D.3. CHANGES TO THE HOUSEHOLD INTERVIEW**

Modifications to the Household Interview for the 2001 NHTS included:

- Both the 1995 and 2001 surveys asked for the total number of household vehicles. However, in 2001 the wording of the question was modified to explicitly ask the respondent to include recreational vehicles, mopeds and motorcycles. This was because DOT felt that households may have underreported these vehicles in previous surveys.
- For the 2000 Census, the Census Bureau modified the question on "race" to handle multiracial households. This question was also modified in the 2001 survey to record multiple races.
- In past NPTS surveys DOT was concerned about coverage of college students. For the 2001 survey, students in dorms, fraternity, and sorority houses with less than 11 people sharing one phone number were considered eligible households. (In the 1995 survey, many college students were included, but in 2001 the rule was clarified).

### **2-D.4. CHANGES TO THE EMPLOYMENT QUESTIONS**

The series of questions that ask about the subject's employment status and travel to work were modified. The 1995 survey asked every household member 16 and over whether they worked full time, part time etc. For the 2001 survey, DOT changed the time frame of the questions to "last week." Therefore, a subject who did not indicate that they worked last week was not asked any work-related questions. The change to "last week" was made for comparability with the journey to work questions on Census 2000. In addition, there were several questions in the travel to work section in 1995 that were excluded from the 2001 survey. These related to detail on the use of public transportation, cost of parking, and carpooling.

### **2-D.5. INTERNET USE**

The 2001 survey includes a few questions on Internet use. The questions were designed to obtain information on the frequency of use. Subsequent NHTS' may

include additional questions to determine how commerce via the Internet impacts trip making.

## **2-D.6. TRAVEL DAY CHANGES**

The following modifications were made to questions that collect information related to daily travel.

- The definition of a travel day trip was slightly modified. As in 1995, a trip was defined as any time a subject went from one address to another. Subjects were advised to include all stops. However, unlike 1995, during trip rostering in the 2001 survey subjects were explicitly asked, "to exclude stops made just to change the type of transportation." During the collection of trip detail at a later point in the survey, respondents were asked about the use of public transportation. DOT felt this change would improve the reporting of trips that used public transportation. However, it may have reduced the reporting of trips made to change transportation that did not involve public transportation (for example, driving to a carpool location to use a carpool).
- More detail was collected on trip purposes than in past surveys. For the 2001 survey, there were 36 purpose categories compared to 17 categories on the 1995 NPTS. Because of the increased detail, interviewers were able to more accurately code purposes provided by respondents. Appendix D provides detail on trip purpose coding and the trip purpose variables on the 2001 NHTS.
- More detail was collected when obtaining addresses. For example, a respondent who was unable to provide a street address for a workplace was asked for the name of the employer, nearest intersection, and a landmark.
- During the rostering of trips, respondents were explicitly reminded to include trips they were likely to forget such as walks, bike rides and other trips that started and ended in the same place.
- During the rostering of trips, respondents were asked to provide both the time when each trip began and the time when they arrived at their destination. During the 1995 survey, respondents only provided the time each trip began during trip rostering.

## **2-D.7. TRAVEL PERIOD CHANGES**

Past NPTS surveys collected limited information on long-distance travel. Since the 2001 NHTS was designed to replace the ATS, it collected more detailed information on long-distance trips than previously collected in the NPTS. Major differences between the 1995 ATS and the 2001 NHTS long-distance trip section are listed below:

- The long distance trip definition was changed to capture trips of 50 miles or more away from home, as compared to 100 miles or more in the 1995 ATS. In addition, the 2001 NHTS included trips made for commuting purposes that were previously excluded in the 1995 Survey.
- The reference period for long-distance trips changed to a four-week period anchored by travel day. (This compares to a two-week period in the 1995 NPTS and a one-year period in the 1995 ATS.) The 1995 ATS utilized a panel design of households and collected long-distance trip information over a period of one year. Each household was interviewed four times or during four waves, persons were asked to recall trips made during the previous three months at each wave.
- Information on side trips were excluded in the 2001 NHTS design. The new design also modified and expanded the categories for trip purpose and transportation mode for comparability to the daily travel section of the 2001 NHTS.

## **2-D.8. MOST RECENT TRIP**

Subjects that reported no long-distance trips during their assigned four-week travel period were asked to provide detail on their most recent long-distance trip. Subjects who had not reported a long-distance trip by train were asked about their most recent long-distance train trip.

## **2-E. TYPICAL NHTS HOUSEHOLD**

### **2-E.1. TYPICAL NHTS HOUSEHOLD: HOUSEHOLD INTERVIEW**

At this point, we continue the example of the hypothetical household mentioned in Section E of Chapter 1. Here we describe their interactions with the 2001 NHTS project, by walking through each stage of contact with the household and types of information collected at each stage.

First, an interviewer called and spoke with Amy. The household was screened to verify that it was residential by determining that the telephone number was used for home use, and the household interview was conducted. Towards the end of the household interview, the interviewer told Amy that the household's assigned travel day was Wednesday, April 25, 2001 and asked that each household member record key information about their travel on that day in a diary that would be sent to them. The interviewer set an appointment to call the household back on April 26, 2001, to collect their travel information. In this example case, only one call was required to both screen, and administer the household interview. The household questionnaire is displayed in Appendix M.

**Household Interview - Amy completed the household interview on April 15, 2001 and she is termed the household respondent**

Key information Amy provided during the interview was:

- The household owns a 1999 Toyota Camry and a 2000 Ford Contour,
- Amy is 37 years old, a female, and an African American. She is employed and the primary driver of the Ford,
- Keith is 39, a male, the husband of Amy, employed and the primary driver of the Toyota,
- Lucy is 16, a female, the child of Amy, not employed and a driver,
- Ben is 10, a male and the child of Amy, and
- Their mailing address, which is also their home address, is 2370 SW Fifth Street, Anycity, Anystate.

### **2-E.2. TYPICAL NHTS HOUSEHOLD: DIARY MAILING**

On April 16, 2001, a Priority Mail package was mailed to the household. The package contained a letter thanking the household for agreeing to participate in the survey, a brochure, a map showing the location of the household and demarcating locations over 50 miles from the home, a reminder card showing the household's travel day, an odometer reading form showing the two vehicles that Amy reported as owned by the household, and four envelopes - one addressed to each of the household members. Each of these envelopes contained a travel diary and a two-dollar cash incentive. These diary materials are displayed in Appendix N, Field Documents.

### **2-E.3. TYPICAL NHTS HOUSEHOLD: REMINDER CALL**

On April 24, 2001, the day before the household's travel day, an interviewer called the household. The interviewer reached Amy and asked her if she had received the diary package and had any questions. She also reminded Amy to remember to ask her family to record their travel on the following day in their diaries and answered any questions or concerns Amy had about the survey.

### **2-E.4. TYPICAL NHTS HOUSEHOLD: PERSON INTERVIEW**

The first call to complete a person interview was made on April 26, 2001. On April 28, after several call attempts, an interviewer reached Amy at home and completed her person-level interview.

**Person Interview - Amy completed her person interview on April 28, 2001, 13 days after the Household Interview and 3 days after the Travel Day**

Information not related to the travel day and travel period that Amy provided during her person interview included:

- She worked most of last week and works full time,
- Her workplace is at 123 Frontage Road, Anycity, Anystate which is 9 miles from her home,
- It usually takes 20 minutes one-way to get to her workplace and she does not use a carpool,
- She never works at home in place of going to her workplace, and she does not drive as part of her job,
- Highway congestion, the price of gasoline, and rough pavements are not a problem for her,
- She did not walk outside for exercise or ride a bicycle last week,
- She drove about 13,000 miles in all vehicles last year,
- The Ford Contour was driven about 12,000 miles by all drivers last year,
- In the past two months she used public transportation once a month,
- She does not have access to the Internet or world-wide web,
- She does not have a medical condition that makes it difficult to travel,
- She is a high school graduate and was born in the US,
- The total income of her household is \$45,000 or more, and
- Her household has just one telephone.

### **Person Interview continued with Amy's Travel Day**

Information Amy provided about her travel day included:

- She took seven trips as follows:
  - 7:45 a.m. to 8:05 a.m., from home to work
  - 12:30 p.m. to 12:40 p.m., from work to a restaurant
  - 1:20 p.m. to 1:40 p.m., return to work
  - 5:30 p.m. to 5:35 p.m., from work to the bank
  - 5:45 p.m. to 6:05 p.m., from the bank to home
  - 7:25 p.m. to 7:45 p.m., walk the dogs with Keith
  - 7:46 p.m. to 8:05 p.m., return home after walk
  
- Trip detail collected on sample trip to lunch:
  - The purpose of the trip was to eat a meal
  - She did not use a vehicle, but walked
  - The restaurant was three blocks from work
  - It took 10 minutes to make the trip
  - Two non-household members made the trip with her
  
- Trip detail collected on sample trip to the bank:
  - The purpose of the trip was to use professional services
  - She used her Ford Contour
  - The bank was 3 miles from work
  - It took 5 minutes to make the trip
  - She was the driver and drove alone

### **Person Interview continued with Amy's Travel Period**

Information Amy provided about long-distance trips of 50 miles or more that she made during her four-week travel period included:

- She made one long-distance trip to Anycity, Anystate that began on April 27, 2001
- She returned home on April 29, 2001 after completing the trip
- This trip was not a recurring trip and was made just once during the travel period
- She traveled alone on the trip
- The main transportation used to get to her final destination was a commercial airplane, she drove to the airport in her car and used a taxi to get to her destination from the airport
- The main purpose of the trip was a business meeting
- She stayed in a hotel while at the final destination
- She made no overnight stops on her way to or from her final destination

On completion of her person interview, Amy completed a proxy interview for her son, Ben. Her husband, Keith, and daughter, Lucy, were contacted directly for their interviews.

#### **2-E.5. TYPICAL NHTS HOUSEHOLD: FIRST ODOMETER READINGS**

At the end of the person interview, the interviewer asked Amy for the odometer readings. They were not available. Later, during Keith's person interview the interviewer once again asked for the odometer readings. Keith too indicated that they were not available. Keith agreed to record the readings. The interviewer informed him that someone would call back to collect them.

After the six-day period allowed for collection of travel information from the household had expired an interviewer called the household to collect the odometer readings. The interviewer obtained the readings from Keith on May 5, 2001 on the fifth call attempt.

**First Odometer Readings provided by Keith**

- The Toyota has 36,800 miles and the Ford has 24,250 miles
- Both readings were recorded on May 3, 2001

**2-E.6. TYPICAL NHTS HOUSEHOLD: SECOND ODOMETER READINGS**

Around July 3, 2001, sixty days after the first readings were recorded, a form was mailed to the household requesting a second reading. The form displayed the two household vehicles, the first readings and the date the readings were recorded. The household was informed that they could provide the readings by:

- Recording them on the form and returning it in the postage-paid return envelope that was included in the mailing,
- Fax the completed form using the facsimile number provided,
- Call the toll-free number and provide the readings to an interviewer, or
- Use the Internet and the password provided to access their household's vehicle information and record the second readings and the date of those readings.

A review of the database in September 2001 showed that the household had not provided second readings. Therefore, an interviewer telephoned the household several times, making contact with Amy on the third call attempt. Amy agreed to record the readings. The interviewer called back the next day, September 21, 2001, and collected the information.

**Second Odometer Readings provided by Amy**

- The Toyota has 39,796 miles and the Ford has 27,540 miles
- Both readings were recorded on September 20, 2001

## **2-E.7. TYPICAL NHTS HOUSEHOLD: THANK YOU POSTCARD**

Completed households were sent a postcard thanking them for their participation in the survey.

## **CHAPTER 3. SURVEY PROCEDURES AND METHODOLOGY**

### **3-A. OVERVIEW**

#### **3-A.1. HOUSEHOLDS ELIGIBLE FOR THE NHTS**

The NHTS collected travel data from the civilian, non-institutionalized population of the United States. People living in medical institutions, prisons and in barracks on military bases were excluded from the sample. However, telephone numbers in dormitory rooms, fraternity and sorority houses were included so long as no more than 10 people shared the same telephone number.

The focus of this User's Guide is the 69,817 useable households in the full sample. This includes 26,038 households in the national sample, 28,899 households in the Westat add-on sample, and 14,880 households in the Morpace add-on sample. The first public release of data for these households was made in January 2003. The January 2003 dataset contained the daily trips for the national sample households. The final NHTS dataset, provided to DOT in January 2004, contained 69,817 households. The dataset did not include travel period data. BTS has assumed responsibility for publishing this dataset.

All telephone numbers in households in the sample that were found to be residential were eligible for the household interview. The household interview had to be completed by a household member who was at least 18 years old. The exception to this rule was emancipated households in which the age of every household member was less than 18 years.

Interviewers could directly interview household members who were 16 years and older. Proxy interviews were requested for all younger household members. However, if asked by an adult household member, an interviewer could directly interview a household member who was 14 or 15 years old.

### **3-A.2. HOW THE DATA WERE COLLECTED**

The NHTS was conducted as a telephone survey, using Computer-Assisted Telephone Interviewing (CATI) technology. The sample Westat used for the national survey and New York and Wisconsin add-ons was a list-assisted random digit dialing (RDD) telephone number sample.

Westat randomly pre-assigned each telephone number in the sample a day of the week. During the household interview, each household was assigned a specific date as their "Travel Day" and a four-week "Travel Period" for which detailed data on travel were collected.

Some households (those that could be associated with an address through their sampled telephone number) were first contacted by an advance letter containing a pre-survey monetary incentive to participate, followed about a week later by a telephone interview. The remaining households were first contacted by telephone. After the first telephone interview, referred to as the household interview, travel diaries and an additional monetary incentive were mailed to the household so that each household member could record their travel on the assigned travel day. A reminder call was made to each household on the day before their assigned travel day.

Household members were contacted by telephone during a six-day window beginning with the day following the travel day to complete a person interview and provide their travel.

Odometer readings for each household vehicle in completed households in the national, New York and Wisconsin add-on samples were also collected by contacts at two points in time.

### **3-A.3. WHEN THE DATA ARE COLLECTED**

The 2001 NHTS interviews for the national sample and New York and Wisconsin add-ons were conducted from March 19, 2001 through May 9, 2002. Interviews for households in the seven Morpace add-ons were conducted between May 31, 2001 and July 5, 2002.

The survey must be conducted over at least a 12-month period so that seasonal variations in travel are represented. As in 1995, the 2001 NHTS took 14 months, rather than 12 to complete. This was because interviewers were trained in waves and it took a few months to train all the interviewers needed for the study. The weighting adjusts for the monthly differences in number of interviews completed.

Travel day dates were assigned to all seven days of the week, including holidays. The assigned travel period was the four-week period ending with the assigned travel day. The intent was to represent travel across an entire year.

#### **3-A.4. GEOGRAPHIC COVERAGE**

Interviews were conducted with households in all 50 States and the District of Columbia. Westat drew a new sample of telephone numbers every quarter to ensure that new exchanges and telephone numbers were included and all geographic areas were completely represented in all seasons.

#### **3-B. SAMPLE DESIGN AND SELECTION**

##### **3-B.1. OVERVIEW**

This survey was designed as a list-assisted random digit dialing survey, to yield an equal probability sample of households with telephones. The national sample was increased in several add-on areas: New York State, Wisconsin, Texas, Kentucky, Hawaii, Lancaster Pennsylvania, Baltimore Maryland, Des Moines Ohio and Oahu Hawaii. The supplemental sample in these areas was not included in the January 2003 dataset but was included in the January 2004 dataset.

The target sample size was 25,000 completed households for the national sample, 10,884 completed households for the New York add-on and 16,000 completed households for the Wisconsin add-on.

### **3-B.2. SAMPLING FRAME**

Westat's sampling frame consisted of all telephone numbers in 100-banks of numbers in which there was at least one listed residential number. A 100-bank is a set of 100 telephone numbers with the same first eight digits, that is, the same area code, exchange, and the next two digits. Each quarter, a new sampling frame was constructed and sample was selected for use until a new sample was drawn. Sampling frames were constructed as of December 2000, March 2001, June 2001, September 2001 and December 2001.

### **3-B.3. SAMPLE SELECTION**

Telephone numbers were sorted according to several variables and a systematic sample was then selected from the sorted list. For the national sample, all telephone numbers in the frame of 100-banks had an equal probability of selection.

For the national sample, the sort of telephone numbers was first by the nine Census Divisions and second by metropolitan area/non-metropolitan area. For metropolitan areas, the initial sort was by population of the metropolitan statistical area (MSA) and primary metropolitan statistical area (PMSA) (largest to smallest). Within an MSA/PMSA, telephone exchanges were ordered by those serving the county (or counties) containing the central city, followed by those serving the remaining non-central city county (or counties). Within each county, exchanges were ordered numerically - lowest to highest.

For non-metro areas, the initial sort was by state within a Census Division, with a serpentine ordering<sup>1</sup> from north to south and from east to west. Within state, non-metro counties were similarly ordered in a serpentine fashion, north to south and east to west. Finally, within county, exchanges were ordered numerically from lowest to highest.

---

<sup>1</sup> Serpentine Ordering: The listing begins in the most Northeast state in a given Census Division, followed by the state just south and still at the eastern edge of the Division. After the far Southeast state in the division, the listing proceeds to the state just west of the most Southeast state. The sort continues with the next state to the north. The listing continues in this fashion until all states in the Division have been included.

### **3-C. DATA COLLECTION PROCEDURES**

#### **3-C.1. OVERVIEW**

Data collection for the national sample of the 2001 NHTS, as well as the New York state and Wisconsin add-on samples, was conducted by staff at six Westat Telephone Research Centers (TRCs). The centers used were located in Frederick, MD, Sarasota, FL, Sacramento and Merced, CA, Greeley, CO and Chambersburg, PA. Westat is a social science research firm headquartered in Rockville, Maryland. Data collection for the seven Morpace add-ons was conducted from Morpace's telephone center in Sterling Heights, Michigan.

#### **3-C.2. INTERVIEWER TRAINING**

A staff of approximately 345 Westat interviewers and 58 supervisors were trained on the 2001 NHTS. These interviewers were trained during 16 separate training sessions conducted periodically over the 14-month data collection period. The peak number of interviewers working on the study in any week was 186. This includes interviewers who worked on the national, New York, and Wisconsin survey samples. Of the 345 interviewers, 38 interviewed in both English and Spanish.

All Westat interviewers assigned to the survey participated in training sessions and completed at least 24 hours of formal project-specific training. For interviewers with no prior interviewing experience, these hours were in addition to four hours spent in training on general interviewing skills and another four-hour-plus training on the use of the CATI system. These eight hours of non-project specific training occurred prior to the interviewer's assignment to the NHTS project. For the NHTS project, 60 percent of the 345 interviewers were experienced and did not have to go through the non-project specific training. Interviewers whom the TRC supervisory staff felt were not ready for "live" interviewing at the conclusion of the formal "classroom" training received additional training time.

### **3-C.3. INTERVIEWER MONITORING**

Interviewer monitoring is an important aspect of survey quality control, and Westat, Morpace, and DOT staff devoted considerable time and attention to it. Using extension telephones and personal computer displays linked to the interviewer's computers, supervisors silently monitored about 10 percent of each interviewer's work over the course of the study. DOT and non-TRC Westat staff monitored interviewers in all six TRC's from monitoring rooms located at Westat in Rockville, MD. Staff from DOT also monitored interviews in-person from Morpace's telephone monitoring center in Sterling Heights, Michigan on two occasions and remotely by connecting to Morpace's CATI.

### **3-C.4. CALLBACK PROCEDURES**

Effective calling patterns are essential to achieving a high response rate on all telephone surveys. Westat made at least seven attempts to establish contact to screen a household and a minimum of eight attempts to establish subsequent contact to complete each person-level interview with each household member. A computer algorithm scheduled these calls over different days and included day, evening and weekend calls.

### **3-C.5. REFUSAL CONVERSION**

Refusal conversion was an important aspect of Westat's overall response maximization effort for the NHTS. An integral component of this effort was the utilization of a select team of refusal conversion specialists. The team was comprised of TRC interviewer staff members who had demonstrated exceptional skills in achieving high cooperation rates. Once interviewers were familiar with the questionnaires, and common reasons for refusals were identified, Westat supervisors held special training sessions on refusal conversion techniques for the refusal conversion interviewers.

Whenever a respondent initially refused to complete an interview, the interviewer completed a separate CATI data collection module to record any information known about the household and the respondent's reason(s) for refusing to participate.

A project supervisor reviewed each case and non-hostile refusals were returned to interviewers specially trained in refusal conversion for additional calls to the household.

### **3-C.6. BILINGUAL INTERVIEWING**

Interviewing on the NHTS was conducted in both English and Spanish. Interviewing in Spanish was an important factor in gaining the cooperation of Hispanic respondents and completing interviews with them. Westat bilingual interviewers completed the full survey interviewer training in English, and conducted interviews in English until they were thoroughly familiar with the questionnaires and CATI system. They also attended additional training on the Spanish CATI instruments. Westat translated the entire CATI questionnaire, as well as all instructions to interviewers and clarifying comments into Spanish. Spanish-speaking supervisors monitored the bilingual interviewers.

All cases assigned an initial result code of "language problem" by an English-speaking-only interviewer were available only to bilingual interviewers. If the bilingual interviewer determined that the respondent spoke neither English nor Spanish, attempts were made to conduct the interview using an English-speaking household member as a proxy. If these attempts were not successful, a final code of "language problem" was assigned to the case. Only 610 households (1 percent), out of the estimated 63,472 residential households in the national sample, could not be interviewed because of a language barrier.

### **3-C.7. CONFIDENTIALITY PROCEDURES**

All data on the national survey were collected with an assurance that all information that could identify a specific respondent would remain confidential. All Westat and DOT personnel, including interviewers and professional staff, signed an affidavit stating that they would maintain the confidentiality of all survey data.

### **3-C.8. ADVANCE LETTER AND CASH INCENTIVE TO HOUSEHOLDS**

As discussed in Sections 2-B.1 and 3-A.2, a subset of households in the sample were mailed an advance letter. These were households for whom Westat and Morpace were able to obtain mailing addresses. The mailing of these advance letters was timed so that the household received the letter shortly before the first telephone call to the household. This was accomplished by releasing the sample to the interviewers in small groups. A mailing occurred prior to each release of the sample.

The advance letter mailing included the letter from the Secretary of Transportation, a five-dollar cash incentive for the national and New York samples and a two-dollar cash incentive for the Wisconsin sample, and a brochure introducing the survey. The letters sent to respondents in the seven Morpace add-ons were signed by a dignitary for the add-on region. Appendix N, NHTS Field Documents, contains a copy of the advance letter and the brochure. The primary purpose of the mailing was to improve cooperation rates by informing prospective respondents that this was a legitimate survey, not a marketing or fundraising call.

Westat was able to obtain addresses for 86 percent of the residential numbers in the national sample. About 5 percent of the advance letters were returned as "undelivered" by the post office. Therefore, approximately 81 percent of residential households received the advance letter.

### **3-C.9. TRAVEL DAY AND TRAVEL PERIOD ASSIGNMENT**

During the administration of the household interview, Westat's CATI program automatically assigned a travel day and travel period to each household. The interviewer identified the travel day to the household respondent during the interview. The travel period assigned was the four-week period ending with the travel day. Though the system assigned the travel period, the interviewer did not provide the household with the travel period during the household interview. However, the travel period dates were included in the mailout materials, along with a map showing a 50-mile radius from the household.

Travel characteristics are known to vary by season of the year and day-of-the week. There was some variation in number of completed interviews by month. For example, for the national sample April had more sample because interviewing was done in both April 2001 and April 2002. Because of national events such as September 11, 2001 and the anthrax scare there were also some months in which there were relatively fewer completed interviews. To control for this, part of the weighting process adjusted the estimates of total persons and total households to be equal for each calendar month. See Chapter 5 and Appendix H, for further details.

The variation in travel by day of the week for the Westat sample was balanced by assigning the travel days for one-seventh of the sample telephone numbers to each day of the week. When the calls to a sample phone number resulted in a completed household interview, the CATI system determined the household's travel date on the selected day of the week 10 to 14 days in the future, which allowed time for dairy mailings to reach the household. Morpace also followed a procedure to balance travel days by day of the week.

### **3-C.10. THE TRAVEL DIARY MAILING**

The use of travel diaries on household travel surveys has been shown to improve the accuracy of trip reporting. Therefore, all household members in households who completed a household interview were sent diaries for their travel day. Of the 160,578 persons who completed person interviews in useable households in the national and add-on samples, 71.1 percent or 114,353 reported having filled out the travel diary. Westat mailed the diary package within a day or two following the completion of the household interview. It was sent via Priority Mail and contained:

- A letter from the U.S. DOT thanking the household for completing the household interview and agreeing to participate in the survey;
- A brochure describing the survey;
- A travel day diary and a two-dollar cash incentive that were included in individual envelopes addressed to each household member and placed in the Priority Mail package. The back of each diary provided guidance on completing the diary and included an example of a completed diary;

- An eye-catching bright yellow reminder card identifying the household's travel day;
- A colored map displaying the household 's home address at it's center with a circle around the home demarcating a distance of 50 miles from the home; and
- An odometer mileage form identifying the make, model and year of each household vehicle, with spaces to enter the odometer readings and the dates they were taken.

### **3-C.11. REMINDER CALL**

Each household received a reminder call on the day before their assigned travel day. The call was designed to find out if the household had received its diary package, answer questions, and remind household members to record their travel in the diary the following day. Interviewers attempted to speak with the household respondent but spoke with any household member 16 and older if the household respondent was not available. If the interviewer reached an answering machine, the reminder to collect travel information was left on the answering machine. Households were asked to call the study's toll-free number if there were any questions.

### **3-C.12. CALL-BACK PERIOD**

There was a six-day period during which interviewers were permitted by the CATI system to call each household member to collect their travel. This limit was established by US DOT because of memory problems beyond six days. Phone calls to collect the diary information from the household usually began the day after the travel day, and continued for the next five days. Though no outgoing calls were made after the close of the six-day period, respondents could call into the toll-free number to provide their information. Such information was recorded up to 10 days after the travel day provided the subject had completed a diary. For the national survey, New York and Wisconsin add-ons 0.6 percent or 773 persons provided their travel information after the end of the six-day window. For the remaining seven add-ons 1,883 or 5.5 percent of persons provided travel information after the six-day window. Overall, 78 percent of the

160,758 person interviews in the 2001 NHTS were completed within three days following the household's travel day.

### **3-C.13. PROXY INTERVIEW PROCEDURES**

A proxy interview is one in which someone else in the household reports for the subject. In the NHTS data collection, an adult household member always served as the proxy for a child under age 14. Proxies were also requested for persons age 14 and 15 years. However, if an adult household member requested that the interviewer speak directly with these teenagers, the interview was conducted with the subject. Proxies were not initially requested for household members 16 years and older.

An issue with proxy interviews is under what circumstances to allow proxies for adult household members, defined here as 16 and older. In the 2001 NHTS, proxies were allowed for these subjects if:

- the subject was not capable of being interviewed because of an impairment or a language barrier;
- the interviewer was told that this subject would not be available for the entire six-day recall period;
- the interviewer was told that this subject would never participate, and the proxy was knowledgeable about the subject's travel on the assigned travel day; or
- the interviewers attempted to reach the subject for the first three days of the six-day callback period, and were not successful.

If the respondent filled out a travel diary for travel day, the proxy household member was asked to find the diary and use it when they served as a proxy for the respondent. Note that the conditions under which each interview was completed are a part of the data files. There are variables for:

- whether the interview was with the subject or a proxy respondent (variable PROXY on the Person, Travel Day and Travel Period Files), and

- if a travel diary was completed by the subject or another household member (variable DIARYCMP on the Person File).

### **3-C.14. REDUCING RESPONDENT BURDEN**

During the person interview, special NHTS trip rostering procedures were applied to reduce respondent burden for household members who traveled together during the travel day or travel period. Burden was reduced at two main points during the interview - during trip rostering and during the collection of trip detail on each trip that was rostered.

During trip rostering, each household member was asked to list all trips taken prior to asking about the detail on each individual trip. If the household member currently being interviewed reported that another household member went on a trip with him/her, then this trip was automatically also recorded on the roster for the other household member, provided that household member had not yet been interviewed. When the interviewer talked with this other household member, (s)he merely had to confirm that the household member went on the trip. The household member had to agree with the trip destination and start and end times for the trips to be considered identical. If the household member agreed that the trips were the same, the trip was retained on the roster, otherwise, it was deleted. For travel day, if the household member agreed that the previous household member was correct and the trip was retained on the roster, then this subsequent household member, if not the driver on the trip, was not required to provide any detail on the trip. Trip detail was copied from the previous household member. The driver on a particular travel day trip was always required to report the trip details. For travel period, trip detail was not obtained from a subsequent household member if that household member indicated that during the entire duration of the trip they were with the household member who had already provided the trip detail.

### **3-D. DATA EDITING**

#### **3-D.1. ONLINE EDITS**

Westat conducted most of the editing on the NHTS online while the interviewer had the respondent on the telephone. This editing was accomplished by programming the edits into the CATI software so that the interviewer automatically asked the appropriate next question and was prompted when a response entered to a particular question was not a likely response. All the online edits used in the NHTS are documented in the household and person questionnaires that are included as Appendix J to this report. These online edits fell into three main groups:

- Skip edits that moved the interviewer to the appropriate next question based on responses provided to earlier questions. For example, a subject that was 6 years old was not asked employment questions;
- Range edits that prompted the interviewer when a response entered was possibly incorrect. For example, a response that indicated that a particular vehicle was driven 45,000 miles in the past 12 months. For some variables, both hard and soft ranges were programmed into the CATI. In the example above, the soft range was 2,000 to 30,000. The hard range was 0 to 200,000. Therefore, in this example, the interviewer was prompted to re-ask the question because the response was not within the soft range. If the subject provided a response of 45,000 a second time, the response was accepted. Responses that exceeded the hard range were recorded in "comments." If needed, ranges were modified post-data collection to accommodate values that exceeded the hard range; and
- Logic edits that prompted the interviewer when a value entered was within the valid range for a variable but did not pass a logic check. For example, the subject informed the interviewer during the person interview that a particular household member was the driver on a particular trip. However, that household member was not recorded as a driver during the household interview or was not reported as being on the trip. In both these scenarios a logic edit would be triggered. The triggering of logic edits sometimes required modifying previously provided information. That is, the current response that the respondent was the driver on the trip may be correct but the earlier response that the subject was not on the trip may need to be modified.

### **3-D.2. UPDATING CATI DURING DATA COLLECTION**

This editing, which was ongoing throughout data collection, occurred after a household or person interview was completed. It involved editing information recorded for a particular item during the CATI interview with information provided by the interviewer but recorded some place else. This information had to be updated later because it had not been possible to code it into the appropriate variable during the interview. Instead the information was:

- Recorded online in "comments" in CATI if the interviewer had not left the case and if the information being provided was not very extensive;
- On a "problem sheet" if the interviewer had left the case or the information being provided was extensive;
- On a form designed to collect specific information that was modified, forgotten or provided after the interviewer could enter the information into CATI; or
- Recorded in an "other specify" category.

Examples of the types of information Westat interviewers entered in "comments" include:

- The response provided by the respondent was out of range and would not be accepted by the CATI software. When this happened, the response was reviewed and if likely, after approval by DOT the range for the specific variable was broadened. If the response was unlikely, it was coded -9 (not ascertained);
- A subsequent response modified an earlier response and the respondent agreed that the earlier response needed to be changed. For example, the household respondent enumerated three household vehicles. But later, when the interviewer asked about the primary driver of each vehicle, they found that one of the vehicles was not licensed and was not in working condition. Information on this vehicle was deleted after the interview; and
- The interviewer entered an incorrect response and left the variable before the response could be modified. For example, the note from the interviewer said that she entered person A as a female when in fact person A should be male.

Examples of information recorded in "problem sheets" include:

- The interviewer completed the household interview and found out at the end of the interview that the respondent was an adult but was not a household member (e.g., (s)he usually lived elsewhere and was just visiting). In such a scenario, the person was deleted from the household;
- The respondent initially refused to provide his/her home address and provided just a mailing address. However, after the interview was completed, (s)he was more comfortable with the study and provided a home address; and
- The interviewer entered data in the wrong proxy case (e.g., the interviewer thought the mother was responding for daughter A when in fact the information was being provided for daughter B). Since the interviewer was midway through the interview, the interview was not interrupted. The error was recorded on a problem sheet and the cases were switched later.

Examples of specific forms used by interviewers included:

- A "missed trip" form. Often respondents informed the interviewer they had forgotten to mention a trip after the interviewer had left the trip roster. In such cases, the missed trip information was recorded on a form and added to the CATI file later; and
- An "odometer" form. If the household did not provide their first odometer readings during the person interview, they were contacted later and the information was recorded on a specific form (see Appendix N, NHTS Field Documents).

Sometimes an interviewer may have felt that the response categories for a particular question did not accurately describe the response provided by a respondent or the categories provided were too numerous and the interviewer felt the need to code the response quickly to keep the interview moving. In such cases the interviewer checked the "other specify" response category and recorded the response in open-ended text. On completion of the interview, these responses were reviewed and were appropriately coded into an existing category, a new category was added, or the response was left in "other specify" as an open-ended response.

### **3-D.3. APPROACH TO POST INTERVIEW EDITING**

In surveys with complex questionnaires and procedures, such as the NHTS, the final dataset reflects fundamental approaches taken in the data collection and editing processes. For the 2001 NHTS, two approaches may have had considerable impact on the resulting data.

The first is the reluctance to impute data. If the respondent did not answer an item, its value was generally not imputed, (i.e., determine what the logical response would be given the response to other items). Carefully performed imputation has its place in many statistical surveys, however Westat and DOT determined that imputation would be limited in the NHTS data. If data was imputed, an imputation/edit flag was set for the variable to indicate the values that were imputed.

Second, a conservative approach was taken regarding changing reported data. If it was determined that what was reported could not have happened, the unlikely response was set to a "not ascertained" (-9) code. The exception to this rule was if the same information could be obtained from another household member or from elsewhere in the subject household member's interview. For example, household member A reported a "start time" for a trip that failed an edit. But, household member B went on the same trip and his reported time did not fail the edit. In this example, the start time that was reported by household member A was modified to reflect the time that was reported by household member B. This was only done when trip data failed an edit. In general, differences in data reported by household members on the same trip were allowed to remain. For example, Person A reports a trip starting at 8:30 am when Person B says the same trip started at 8:35 am.

### **3-D.4. POST DATA COLLECTION EDITING**

On completion of all data collection on the 2001 NHTS, Westat programmed and ran edits designed to check for data consistency. A list of the edits that were run is included in Appendix P, Data Editing. When the value of a variable failed an edit, it was manually reviewed. If the value was highly unlikely, it was revised to "not ascertained" (a code of -9). No flags were set when a response was set to "not ascertained".

However, during the cleaning of responses for travel day trips, it was sometimes necessary to slightly modify a response or impute a missing response. In such cases edit and imputation flags were set to indicate the variables whose data was modified. The situations in which these flags were set are described below.

### **3-D.4.A. EDIT FLAGS**

There are edit flags for each of the following travel day variables: STRTTIME, ENDDTIME, TRPDIST, TRVL\_MIN, TRPTRANS and WHYTRPO1. A flag indicates that the value for the variable has been adjusted. The goal of editing these variables was to decrease the number of trips that had identical or overlapping trip times.

All cases where two or more travel day trips for the same household member had identical start and end times were examined. In most cases these trips were duplicates, i.e. the trip detail on both trips indicated that the exact same trip had been reported twice. Duplicates could have been generated as a result of the trip rostering procedures that were in place to reduce respondent burden. Once it was determined that the trips were duplicates the trip with the least amount of trip detail was deleted from the trip roster.

In addition to cases with duplicate trips, the editing process found travel day trips with times that overlapped with other trips or were completely embedded in other trips. In some cases information was available on another household member's record that could help clarify conflicting information. Whenever possible this information was used to make adjustments to the record with embedded trips.

In some cases the most logical edit was to "split the travel time", these were mostly walk or bike trips. For example, if a walking trip from home was reported from 8:00AM to 9:00AM, and was followed by a walking trip to home from 8:55AM to 9:00AM, then the end time of the first trip was adjusted to 8:30AM and the start time of the second trip was adjusted to 8:31AM. In some of these cases trip distance and travel time had to be adjusted as well.

Other cases involved embedded trips that were on the way to a destination. These were often reported after the interviewer had finished gathering trip information,

thus were recorded on a "Missed Trip" form and manually entered during data editing at a later stage. The most common types that were reported incorrectly involved trips to the gas station, and picking up or dropping off someone on the way to a destination. For example, if a trip to home (recorded in CATI during the interview) was reported from 5:00PM to 5:30PM, and a trip to the gas station was reported from 5:00PM to 5:10PM (recorded on a missed trip form as it was recalled later), then we assumed that the respondent stopped at the gas station on the way home. Therefore, the original trip in CATI from 5:00PM to 5:30PM was modified to a trip from the gas station to home. The start time of the trip was changed to 5:10PM. Unfortunately, when there was an embedded trip reported there was no information on dwell time. That is, the person arrived at the gas station at 5:10PM and left for home from the gas station also at 5:10PM.

For travel period the editing process also identified duplicate, non-travel period and embedded trips. Duplicate trips were those where a subject had multiple identical trips on the trip roster. In such cases the duplicate trip with the least trip detail was deleted. The next category of trips edited involved trips that did not end during the 28-day travel period. Such trips were considered non-travel period trips as they did not meet the definition of a travel period trip for the household and were deleted. The final category of travel period trips that were edited involved embedded trips where the start and end dates of one or more trips were embedded in another trip. In such cases, the great circle distance was used to identify the trip that was the farthest destination from home and the embedded trips were edited to overnight stops on this main trip. A flag EDITSTP was set to indicate that the travel period trip was edited to an overnight stop.

### **3-D.4.B. IMPUTATION FLAGS**

There are imputation flags for each of the following variables: STRTTIME, ENDTIME, TRVL\_MIN, AGE, TRIPDIST, OTHRPHON, HHR\_RACE, SEX, HOMEOWN, HOMETYPE and if a whole trip was imputed. A flag for these variables indicates that the variable has been imputed.

One of the goals of this imputation was to decrease the number of travel day trips with missing start and end time values. If both start time and end time were missing the trip was left in the roster in the original order reported by the respondent. If

start time was missing but end time was known or vice versa, and trip distance and mode were reported, then we were able to estimate the travel time of the trip and subsequently impute the missing start or end time. The following rules were used to estimate travel time based on mode and distance:

- If the mode is local transit bus, school bus, subway, trolley (TRPTRANS=10,12,17,18), and the trip distance is  $\leq 15$  miles, then we used an average estimated speed of 10 mph,
- If the mode is local transit bus, school bus, subway, trolley (TRPTRANS=10,12,17,18), and the trip distance is  $> 15$  miles, then we used an average estimated speed of 20 mph,
- If the mode is car, van, SUV, pickup truck, other truck, recreational vehicle, motorcycle, commuter bus, charter bus, city to city bus, Amtrak, commuter train, taxi cab, limo, shuttle (TRPTRANS=1, 2, 3, 4, 5, 6, 7, 11, 13, 14, 15, 16, 22, 23, 24), and the trip distance is  $\leq 15$  miles, then we used an average estimated speed of 25 mph,
- If the mode is car, van, SUV, pickup truck, other truck, recreational vehicle, motorcycle, commuter bus, charter bus, city to city bus, Amtrak, commuter train, taxi cab, limo, shuttle (TRPTRANS=1, 2, 3, 4, 5, 6, 7, 11, 13, 14, 15, 16, 22, 23, 24), and the trip distance is  $> 15$  miles, then we used an average estimated speed of 50 mph,
- If the mode is bicycle (TRPTRANS=25), for any trip distance, the average estimated speed used was 10 mph,
- If the mode is walk (TRPTRANS=26), for any trip distance, the average estimated speed used was 3 mph, and
- If the mode is anything else (airplanes, ships, ferry's boats, other) the data was left as is as the variation was too great to estimate the trip time duration.

Once travel time was estimated, the imputed start or end time was calculated by subtracting the estimated travel time from the end time. The imputed end time was calculated by adding the estimated travel time to the start time. In all cases where a start or end time was imputed, the trip fit into the travel day roster without causing any overlapping trips.

In addition to missed trips reported for the subject on missed trip forms, trips not reported for the subject during the person interview were also imputed. These trips were imputed when a subsequent household member reported that a household member who had completed a person interview earlier had accompanied them on a trip. Since the earlier household member had already completed the interview, it was assumed that (s)he had forgotten to report the trip. The missing trip from the subsequent household member was copied to the travel day record for the household member who had completed the interviewer earlier. An imputation flag to set to indicate trips that were added.

The other variables such as AGE, SEX, OTHRPHON, etc. were imputed during the weighting process if the value for the variable was missing (-7. -8 or -9).

### **3-D.5. IMPUTING DATES FOR RECURRING TRAVEL PERIOD TRIPS**

After a person reported a long distance trip, they were asked if they had taken this trip more than once during the 28-day reporting period, and if so, how many times they took it. Trips taken more than once during the travel period were defined as recurring trips.

We imputed for the missing departure date (IMPTLEDT), the date the trip ended (IMPTREDT), and the number of times (IMPTNTIM) the recurring trip was made during the travel period. In addition, for some reported first trips, to reduce the number of trips that had identical or overlapping trip times, we edited the start date, end date, number of times or the flag variable showing whether the trip is a recurring trip (EDITRECU). A flag for these variables indicates that the variable has been imputed or edited.

To reduce respondent burden trip detail was collected for just the first trip in the recurring trip series. The travel period file shows each recurring trip as a separate trip. To do this a procedure was developed to impute dates for each such recurring trip. The variables IMPTREDT and IMPTLEDT indicate whether the date was imputed.

The imputation procedure evaluated several factors prior to assigning a date. When possible, the date was assigned to the same day of the week. For example, if a

trip was reported for the first Tuesday in the 28-day period and there was one additional such trip taken, it would be assigned to the third Tuesday of the 28-day period. When there were more trips reported than could be assigned to the same day of the week, then recurring trips were assigned to another “weekday” if the reported trip was on a “weekday” and to another “weekend” day if the reported trip was on a “weekend”. Depending on the purpose of the trip, “weekend” was defined as Saturday and Sunday, or as Friday, Saturday and Sunday. Other factors evaluated included whether the subject had any other trips overlapping with the imputed trips. For example, if the dates imputed were from March 1 to March 3, 2002 but the subject had another travel period trip on March 2, then another date was imputed. The procedure also looked at the other household members that were on the trip and ensured that the date assigned did not conflict with other trips these household members may have taken. Finally, recurring trips were assigned the same date as the travel day if the subject’s travel day trip information indicated that s(he) took a trip of 50 miles or more from home if certain conditions were met. If the recurring trip started and ended the same day, then it was assigned the same date only if the travel day trip information indicated that the trip started and ended the same day. Similarly, if the recurring trip involved being away overnight, then it was assigned the same date only if the travel day trip information indicated that a trip started before the travel day.

### **3-D.6. TRIP REPORTING**

The travel day trip roster for each household member who completed a person interview provides a listing of all trips taken on the travel day. However, to reduce respondent burden, not all household members were asked to provide trip detail for each trip taken. For example, trip detail was not asked on proxy interviews if the same trip was self-reported earlier by another household member. Post data collection, trip details recorded during the interview with the self-reported household member were copied to the record for the proxy household member who reported being on the same trip.

A similar procedure was implemented for travel period. That is, after travel period trip detail was recorded for a particular trip, subsequent household members who reported being on the same trip were asked if they were with the previous household

member at all times on the trip. If they were, then trip detail was not collected from subsequent household members.

### **3-D-7. DATA MOVED FROM CATI TO DATA FILES SPECIFIED BY DOT**

The CATI data set was converted into a SAS data set and separated into public use data files based on the specifications provided in the Codebook included in Appendix B. The data files created had several "derived variables" that were created by either renaming CATI variables or combining multiple variables. The specifications for creation of the derived variables are included in this report as Appendix D, Derived Variables. During this step, the survey weights and other variables not collected during the survey were also appended to the data files.

The version of the User's Guide for the Public Use data set released in January 2003 did not include data collected on long-distance travel. The Version 2 release to DOT in the Summer of 2003 contained both travel day and travel period data and therefore included the four files below in addition to the travel period trip file. The final January 2004 delivery included the following four files. BTS will be responsible for the release of the travel period trip file.

- **Household file** - data collected once for the household (one record per household),
- **Person file** - data items collected once for each interviewed household member (one record for each completed person interview),
- **Vehicle file** - data items related to the household 's vehicles (one record for each household vehicle),
- **Travel day trip file** - data items collected for each trip an interviewed person made on the household 's travel day (one record for each travel day trip each person made), and

### **3-D.8. USEABLE HOUSEHOLDS**

The data files contain information on only households that are "useable." A useable household in the 2001 NHTS is one in which the household interview was

completed, and person interviews were completed with at least 50 percent of the adult (age 18+) household members. Though all completed household and person interviews in the CATI database were edited, only information for useable households has been provided in the four files.

A household interview was considered complete if the:

- Interviewer asked every applicable question in the household questionnaire and set an appointment to call the household back to collect diary information;
- The household respondent provided the complete household roster information for the household; and
- The household respondent provided an address for mailing the travel diaries to the household.

The person interview was considered complete if the interviewer administered every applicable question to the subject during the person interview. That is, the interviewer got to the last question in the questionnaire and was able to thank the subject for participating in the survey.

Table 3-1 shows the number of household and person interviews completed during the 2001 NHTS. This public use dataset contains information on the 69,817 useable households in the national sample. Although the definition of a useable household required only 50 percent of adults to complete a person interview, Table 3-1 shows that for the January 2004 release (Version 3) sample for 60,520 or 86.7 percent of useable households, person interviews were completed with all adult household members in the household.

**Table 3-1. Number of Completed Household and Person Interviews: Overall, in Useable, 100% Households, and Non-Useable Households**

<b>Survey Completion Level</b>	<b>Completed Household Interviews</b>	<b>Completed Person Interviews</b>
Overall Number of Completed Interviews	106,598	163,856
Useable Households	69,817	160,758
Number of Completed Interview in 100% Households (All Adult Household Members completed a Person Interview)	60,520	144,884
Non Useable Households	36,781	3,098

### **3-D.9. HUNDRED PERCENT HOUSEHOLDS**

For some applications, particularly those involving planning models, the data user may want to access only those households where all adults in the household were interviewed. These are the 60,520 households shown in Table 3-1 above. If a user wants to limit analysis to these 100% households, a separate weighting factor can be used to expand the 100% households to annual, national estimates. This weighting factor is EXPFLLHH on the household and vehicle files, EXPFLLPR on the person file and EXPFLLTD on the travel day trip file.

### **3-D.10. EDITING THE DELIVERY DATASETS**

As a final editing step, frequencies for useable households on both the CATI dataset and the delivery datasets were compared. Next, edits were run on the four delivery data sets to ensure consistency in the reporting of values across the four delivery files.

### **3-E. SURVEY METHOD AND PROCEDURE CHANGES**

#### **3-E.1. 2001 NHTS CHANGES**

The 2001 NHTS represents a significant change in survey methods and procedures from earlier national travel surveys. In Section 2-D, Survey Content Changes in 2001, we presented changes to the questionnaire content in 2001. Therefore, in the items that follow we focus on modifications to survey methods and procedures introduced during the 2001 NHTS.

1. The 2001 NHTS saw the combination of two travel surveys, the National Personal Transportation Survey (daily travel) and the American Travel Survey (long-distance travel). Each household that completed a household interview was assigned both a travel day and travel period. Detailed travel information was collected on both daily and long-distance travel.
2. The advance mailing to households for whom addresses were available included a five-dollar cash incentive and a brochure.
3. All household members were eligible for a person interview, not just household members who were over four years old.
4. Proxy rules were modified. Only subjects 16 years and older were asked to respond for themselves. Proxies were requested for all others. However, if asked by an adult household member, interviewers could directly speak with household members that were 14 and 15 years old.
5. More detailed address information was collected. The off-line geocoding operation used multiple databases and detailed manual searches to determine the latitude and longitude of a location when the address information failed an automated batch geocode search.
6. The second odometer reading for household vehicles was collected using multiple modes of data collection. In addition to mail out/mail back and interviewer initiated telephone data collection, modes also included the use of the Internet, facsimile machines and a toll-free 800 number.
7. The process for calculation of weights was more detailed. Steps combined in the past were now separated. For example, non-response adjustments and benchmarking to key variables were performed as separate steps.

8. During the editing process, certain travel day trips reported as single trips were split creating two trips from the original one trip reported by the household member. These usually involved trips that originated from home and were the last trip taken on the travel day without returning home. If such a trip had walk or bike as the transportation mode or the trip destination and had a purpose that was go to the gym/exercise/play sports, go to public place, walk the dog/vet visits, or pick up or drop off someone, the trip was split. In these cases, the survey procedure was to split the trip into an outgoing and a return portion to make them more parallel to the handling of travel day trips by other modes of transportation.
9. During the editing process, at the request of DOT, select trips reported by a household member (e.g., Person B) that were not reported by a previously interviewed household member (e.g., Person A) were added to Person A's trip data if Person B indicated that Person A also traveled on the trip.

Exhibit 3-1 summarizes key changes mentioned in Section 2-D and in this section. The reason for change has also been provided to indicate the probable impact the change may have on the 2001 survey.

**Exhibit 3-1. Changes in the 2001 NHTS Survey Methodology and Content and Their Probable Impacts**

<b>TOPIC</b>	<b>FROM</b>	<b>TO</b>	<b>PROBABLE IMPACTS</b>
<b>What is collected?</b>	Two separate surveys - the NPTS and the ATS	Combined survey that collects both travel day and travel period information	Enables analysis of relationship between daily and long-distance travel characteristics of each person
<b>Which household members are eligible?</b>	Household members age 5 and older	All household members	More complete trip reporting
<b>When proxy needed?</b>	Proxy for household members 5 to 13 years	Proxy for household members under 16 years	Increase in number of interviews by proxy Obtain parental approval when speaking with 14 and 15 year olds

**Exhibit 3-1. Changes in the 2001 NHTS Survey Methodology and Content and Their Probable Impacts (contd.)**

<b>TOPIC</b>	<b>FROM</b>	<b>TO</b>	<b>PROBABLE IMPACTS</b>
<b>Respondent Contact</b>	Advance letter	Advance letter with a \$5 cash incentive and a brochure	Improved response Legitimizes the survey with respondents
<b>Use of a diary for long trips</b>	The ATS used a diary to record long-distance trips	No travel period diary included	Lower respondent burden and reduce the possibility of confusion due to the mailing of both a travel day and travel period diary
<b>Travel day trip definition</b>	Any stop from one address to the next is a separate trip	Basically the same - stops only to change a mode of transportation excluded	May improve reporting of trips by public transportation as subjects were specifically reminded about these trips  No change mode trips were recorded except where public transportation was involved.
<b>Walk and bike trips on travel day</b>	No specific mention of walk and bike trips	Specific reminder to include walk, bike rides and trips that started and ended in the same place	Will increase the reporting of walk and bike trips
<b>Travel period length and travel period trip definition</b>	The NPTS included trips of 75 miles or more and used a 2-week recall period. The ATS included trips of 100 miles or more taken over a full year (4 interviews)	The travel period was a four-week period. Trips of 50 miles or more from home were defined as long-distance	Four-week travel period and shorter criterion distance provides information on a larger sample of long-distance trips than NPTS and better recall of trips than ATS (if not recorded in ATS diary), but a smaller sample of trips and greater difficulty estimating annual long-distance trip rates than ATS. The 4-week travel period may have increased the potential for telescoping (i.e., bringing trips into the travel period)
<b>Travel day trip purpose</b>	There were 17 trip purpose categories	There are 36 trip purpose categories	The new categories more accurately capture responses

**Exhibit 3-1. Changes in the 2001 NHTS Survey Methodology and Content and Their Probable Impacts (contd.)**

<b>TOPIC</b>	<b>FROM</b>	<b>TO</b>	<b>PROBABLE IMPACTS</b>
<b>Most recent long-distance trip</b>	Not collected	Collected	Facilitate the imputation of trips for persons with no reported long-distance trips in travel period
<b>Odometer readings</b>	Readings collected by contacting the respondent by phone or by mail	Data collection modes also included the Internet, fax, and a toll-free 800 number	Improved response
<b>Geocoding</b>	Limited use of manual geocoding	Extensive use of manual geocoding	Higher geocoding success rates and more accurate geocoding
<b>Splitting walk and bike trips at the end of travel day</b>	Not conducted	Conducted	Walk and bike trip rates may be higher than on past NPTSS
<b>Adding trips not reported by household members interviewed earlier</b>	Not conducted	Conducted	More complete trip reporting
<b>Weighting</b>	Raking to control totals <sup>2</sup>	Several stages of separate nonresponse adjustment and trimming as well as raking. Changes to cells used for raking	Presently unknown. An evaluation is to be conducted.

---

<sup>2</sup> In raking, one adjusts estimates to agree to one set of controls (e. g., ethnicity), then adjusts estimates to a second set of controls (e. g., region), etc. This process is then repeated until all estimates are simultaneously close to the full set of controls.

### **3-F. PROCEDURES TO ENSURE CONFIDENTIALITY**

The following measures were taken to produce the public use dataset that accompanies this User's Guide to ensure respondent confidentiality:

- All direct identifiers, such as telephone numbers, zip codes, county codes, names of individuals, and addresses were removed from the dataset;
- Metropolitan Statistical Areas (MSAs) of less than 1 million population, states with less than 2 million population, and states for non-MSA households in states that have a total non-MSA population less than 1/2 million are not specifically identified on the dataset;
- The specific dates when travel day and travel period trips were made were removed from the file; and
- Data values for certain other variables were coded into intervals or suppressed, and some data distributions were capped. For example, detailed year/make/model information for antique and classic autos could compromise respondent confidentiality if fully revealed. In the public use dataset, rare make and model codes were not displayed.

Note: Identifying the MSA or CMSA of a household in an area with a population of one million or more requires the use of two variables: HHC\_MSA and MSASIZE.

## CHAPTER 4. SURVEY RESPONSE RATES

Westat collected data for the 2001 NHTS national sample and New York and Wisconsin add-on samples during the period from March 19, 2001 through May 9, 2002. Morpace collected data for Baltimore, Des Moines, Hawaii, Kentucky (four counties), Lancaster PA, Oahu and Texas between May 31, 2001 and July 5, 2002. As described in Chapter 2, Survey Content and Interviews, there were several stages of data collection for each sampled telephone number. First, each sample telephone number was screened to determine whether it was or was not a residential household. Second, an adult household member in screened residential households was asked a series of questions about the persons and vehicles of the household. During this household interview, the household was assigned a travel day for daily trip reporting. Following the household interview, a diary package was prepared and mailed to the household. Next, the household received a call the day prior to their travel day reminding them to record their travel the next day. Following the household's travel day, interviewers called to conduct the person interview with each household member. During the person interviews, travel information including long distance trips as well as responses to a number of additional questionnaire items were recorded. A summary of the overall response rates, as well as the rates at key stages of the survey process are documented in this section.

Tables 4-1 and 4-2 present the weighted response rates for the 2001 NHTS. These response rates were calculated using results from the weighting process. These weighted response rates provide inherently more accurate estimates of the effective response rates for the study than unweighted response rates would because the weights account for differential sampling, primarily across various geographic areas and to a lesser extent across demographic characteristics. Weighted and unweighted response rates can be far apart when there are major variations in the probabilities of selection and response rates are correlated with these probabilities. For example, the national sample of about 26,000 households represents a sampling rate of approximately one household surveyed for every 4,000 households in the US, thus each national household has an average national weight of about 4,000. At the same time an add-on sample of about 12,000 households in hypothetical State B represents a sampling rate of about one in 600 within that state. Without consideration of the weights, the State B households would contribute nearly seven times more to the

overall response rate than they should. Consider this simple example in the box below. In this example, the response rate is much higher in category A than in category B and the probability of selection is much lower in category A as well (the weight for A is higher). Thus, the unweighted response rate is only 72 percent as compared to the weighted response rate of 78 percent.

	Sample Count			Weighted Estimates (in millions)			
	Respondents	Non-Respondents	Unweighted Response Rate	Weight	Respondents	Non-Respondents	Weighted Response Rate
Category A	26,000	6,500	80%	4,000	104	26	80%
Category B	12,000	8,000	60%	600	7.2	4.8	60%
Total	38,000	14,500	72%	--	111.2	30.8	78%

This type of situation occurs in the NHTS. . The response rates for most of the add-on samples were much lower than the response rate for the national sample for a variety of reasons including differences in methodology and in the target population, and the weights for the add-on samples are much lower than weights for the national sample outside of add-on areas. Appendix I provides unweighted response rates and detailed classifications of households and telephone numbers.

Table 4-1 provides weighted household response rates, for both the full sample (national and add-on) and the national sample. The overall weighted response rate for useable households is 38.9 percent for the full sample and 41.2 percent for the national sample.

At the household level, we provide:

- the overall household response rate for all households,
- the household response rate for households where 50 percent of adult household members completed a person interview (useable households), and
- the household response rate for households where 100 percent of adult household members completed a person interview.

**Table 4-1. Weighted Household Response Rates**

Weighted Response Rates	Full Sample		National Sample	
	Individual Rate	Composite Rate	Individual Rate	Composite Rate
Household Response for All Households that Completed a Screener Interview	56.2%	56.2%	58.2%	58.2%
<b>Household Response for Households where At Least Half the Adults Completed an Extended Interview (Useable Households)</b>	<b>69.2%</b>	<b>38.9%</b>	<b>70.8%</b>	<b>41.2%</b>
Household Response for Households where All Adults Completed a Person Interview	59.3%	33.3%	60.5%	35.2%

The “individual rate” columns provide the response rate for only that stage (i.e., either the screener (household) or extended (person) interview) of the interviewing, while the “composite rate” columns provide the overall response rate. Thus, for example, for the full sample, the useable household response rate among those households that completed the screener interview was 69.2 percent. The overall useable household response rate was the product of the screener response rate and the 69.2 percent rate (response rate at the extended interview level), i.e.,  $(.562) \times (.692) = .389$ .

In calculating household screener response rates, there are many cases where we cannot determine whether the telephone number is eligible (i.e., residential) or ineligible (e.g., business or nonworking number) because the only responses we received were ring no answer or an answering machine. If these numbers are treated as all being residential, the calculated response rate is too low. If they are treated as if none are residential, the calculated response rate is too high.

There are several ways of estimating the proportion of such numbers that are residential. One commonly used method is the so-called CASRO (Council of American Survey Research Organizations) method.<sup>1</sup> This method assumes that the residency rate for the numbers whose eligibility is unknown is the same as the rate for

---

<sup>1</sup> Frankel, 1983

those numbers whose eligibility is known. We have instead used a relatively new method known as the “survival analysis method”.<sup>2</sup> In this method, a small subsample of all telephone numbers is subjected to a larger number of telephone call attempts. This data is then used to fit a Kaplan-Meier estimator for the proportion of numbers that would be found to be residential after many hundreds of calls were made. In general, it is believed that the CASRO method results in overestimating the proportion of unknown numbers that are residential, and therefore produces too low a response rate. In the NHTS, however, the survival analysis method actually produced a slightly higher estimated proportion that is residential: 43.3 percent for survival analysis compared to 41.7 percent for CASRO. Thus, use of the survival analysis method results in a more accurate but slightly lower response rate than use of the CASRO method.

Table 4-2 provides person response rates for:

- Households where 100 percent of adult household members completed a person interview, and
- Households where 50 percent of adult household members completed a person interview.

For example, the individual person response rate of 54.0 percent has a numerator that is completed person interviews in only those households in which *all* adults had completed interviews. The denominator consists of all persons in all households that completed a screening interview. The corresponding composite rate is the product  $(.540) * (.562) = .303$ .

Data users who require additional information regarding individual response rates for the national and add-on components of the NHTS sample should contact Federal Highway Administration’s NHTS User Support (Susan Liss; (202) 366-5060).

---

<sup>2</sup> Brick, M., Montaquila, J., Scheuren, F. (2002) Estimating residency rates for undetermined telephone numbers. *Public Opinion quarterly*, 66, p. 18-39.

**Table 4-2. Weighted Person Response Rates**

<b>Weighted Response Rates</b>	<b>Full Sample</b>		<b>National Sample</b>	
	<b>Individual Rate</b>	<b>Composite Rate</b>	<b>Individual Rate</b>	<b>Composite Rate</b>
Person Response in Households where At Least Half the Adults Completed a Person Interview (Useable Households)	60.6%	34.1%	62.2%	36.2%
Person Response in Households where All Adults Completed a Person Interview	54.0%	30.3%	55.2%	32.2%

## CHAPTER 5. WEIGHT CALCULATIONS

Weights are needed to produce valid population-level estimates. Several stages of nonresponse adjustment and poststratification are done to reduce sampling error and bias. For the 2001 NHTS, two sets of weights have been provided: 1) The full sample, including add-on samples for selected areas as well as the national sample; and 2) The national sample only. For the second set of weights, all add-on sample cases have weights set equal to zero. Different weights are required for households, persons, and travel days. Discussion of which weight to use when is contained in Chapter 7, Section D.

The public use dataset contains person and household weights for:

- Useable households in which person interviews were completed with at least 50 percent of adults in the household (69,817 households in the national and add-on samples, 26,038 households in the national sample) and
- 100 percent households in which person interviews were completed with all adults in the household (60,520 households in the national and add-on samples, 22,178 households in the national sample).

Although it is also possible to tabulate data for other categories of households, the weights provided in the data are appropriate for only the 100 percent and useable households. These other categories of households of interest are:

- Households in which extended interviews (person interviews) were completed with at least one adult in the household (72,004 households in the national and add-on samples, 26,995 households in the national sample), and
- Households for which there was a completed household interview (106,598 households in the national and add-on samples, 36,810 households in the national sample), whether or not there were any completed extended interviews in the household.

## **5-A. HOUSEHOLD WEIGHTS**

### **5-A.1. INITIAL HOUSEHOLD WEIGHT**

The baseweight is the reciprocal of the known probability of selection of a telephone number. The first adjustment to the baseweight is for nonresponse in attempting to complete the household interview. A special adjustment is needed prior to the nonresponse adjustment because it is not possible to determine whether some telephone numbers are residential or not. This occurs when there are only ring-no-answers on repeated calls, and when repeated calls only reach an answering machine. Residency rates for these two situations were determined by fitting survival analysis equations to survey results. This method takes advantage of the fact that telephone numbers reach a final status after a variable number of attempts. To apply this method, it is necessary to make extra attempts for a small sample of telephone numbers. The results of these extra attempts are used to fit an equation for the proportion of numbers that are residential after a given number of attempts. The equation is then used to predict the proportion of undetermined numbers that are residential.<sup>1</sup>

In the nonresponse adjustment, cells were formed, with a separate nonresponse adjustment factor applied for each cell. Characteristics of telephone exchanges, such as percentage of listed households by race or by tenure, were examined to determine where response rates differed. A categorical search algorithm called CHAID<sup>2</sup> was used to determine which variables and categories had the largest differences in response rates. The variables for which response rates differed significantly are given in Appendix H, Weighted Response Rates and Variables Used to Define Nonresponse Adjustment Cells. These differ for the full sample weighting and for the national sample weighting, and so two sets are given in Appendix H.

The next weight adjustment is for interviewed households that have more than one residential telephone line. Such households have a higher probability of selection and thus received a reduced weight.

---

<sup>1</sup> Brick, J. M., Montaquila, J., Scheuren, F. (2002). "Estimating residency rates for undetermined telephone numbers", *Public Opinion Quarterly*, Vol. 66, pp. 18-39.

<sup>2</sup> Kass, G. (1980). "An exploratory technique for investigating large quantities of categorical data", *Applied Statistics*, vol. 29, pp. 119-127.

The weight consisting of the product of the baseweight, the household nonresponse adjustment, and the multiple phone adjustment is called the "initial household weight." This weight is the starting point for all of the different weights.

#### **5-A.2. USEABLE HOUSEHOLD WEIGHT**

For the "useable household weight," a nonresponse adjustment was applied to the initial household weight. Information on characteristics collected in the household interview, as well as the information available on all telephone numbers, was available for determining nonresponse adjustment cells. As in the initial household weight, nonresponse adjustment, CHAID was used to determine the best definition of cells. Variables used in the nonresponse adjustment are given in Appendix H.

The next step for the useable household weight was to control survey estimates to independent controls for various demographic categories, in a process called raking. The source for these controls was the 2000 Census. Census estimates were adjusted for growth between 2000 and 2001 when the majority of data collection on the NHTS was conducted, using estimates from the Census Bureau's Current Population Survey. The variables and the control totals are provided in Table 1 in Appendix F, along with the average adjustment factor for each category, for both the full sample and for the national sample. Weights were first adjusted to assure agreement on the first raking dimension, then weights were adjusted for the second raking dimension, then for the third, etc. Then the process was repeated, again assuring agreement with each of the raking dimensions. The process continued to be repeated, with iterative controlling to each variable, until simultaneously close agreement for each variable was obtained. In addition to variables for which Census data was used, it was desired to ensure equal contributions for each of the seven days of the week and to obtain appropriate contributions by month in which the travel day occurred (varying only by the number of days in the month). We paired months (January and February, March and April, etc.) and controlled estimates by day of week crossed with paired months, creating 42 control categories. These categories were used along with the Census sets in the raking process. We also used controls for MSA center-city, MSA non-center-city and non MSA crossed by individual month.

A final step was to “trim” very large weights. Inordinately large weights tend to substantially increase sampling errors. By not allowing weights to get too large, sampling errors are reduced although there is some loss in the bias reduction due to nonresponse adjustment and raking. Trimming is only for the purpose of reducing large weights, not for editing data in any way. There were 89 weights that were trimmed because they were more than 4.0 times the mean weight for the full sample weighting. In addition, there were some households that were sampled from one jurisdiction in New York or Wisconsin or from outside these states, but turned out to be located in a different jurisdiction that was sampled at a higher rate. The 42 households that had weights more than 8.0 times the mean of the jurisdiction in which they were located had their weights trimmed. After trimming large weights, the raking process was then repeated so that survey estimates would still agree with the control total.

### **5-A.3. HUNDRED PERCENT REPORTED HOUSEHOLD WEIGHT**

The weighting process for the useable household weight was also used for the "100% reported household weight." The nonresponse adjustment had to be done separately for each weight, because there are households that are considered as respondents for useable households (i.e., 50% or more of household adults interviewed) that are nonrespondents for 100% reported households. The variables used in the nonresponse adjustment differ slightly among the weights. The variables used for the 100% reported households are also given in Appendix H.

Raking was then performed separately for each weight. The average adjustment factors for each category in the raking are provided in Appendix F, Control Totals and Adjustment Factors. The final step was again to "trim" very large weights and to then repeat the raking process after trimming. There were 176 full sample weights that needed trimming. In addition, there were 37 weights trimmed because of very large weights due to the household being located in a different jurisdiction than where it was sampled.

## **5-B. PERSON WEIGHTS**

### **5-B.1. USEABLE HOUSEHOLDS PERSON WEIGHT**

The starting point for person weights for useable households is the initial household weight.

A nonresponse adjustment was done similar to the adjustment for the useable household weight. CHAID was again used to determine the best definition of cells. Variables used in the nonresponse adjustment are given in Appendix H. The next step for this person weight was to control survey estimates to control totals from the 2000 Census. Table 2 in Appendix F has the average adjustment factors for each category used in this weighting step. A final step was to “trim” the weights for persons who have extremely large weights (more than 4 times the mean weight). There were 427 full sample weights that needed trimming. In addition, there were 85 weights trimmed because of very large weights due to the household being located in a different jurisdiction from where it was sampled. The process for controlling to Census totals was then repeated so that survey estimates would agree with control totals after trimming.

### **5-B.2. HUNDRED PERCENT REPORTED HOUSEHOLDS PERSON WEIGHT**

The weighting process for the useable households person weight was also used for the 100% reported households' person weight. The set of variables used for the nonresponse adjustment for this weight is the same as for useable households' person weights. Raking and trimming were then performed. There were 731 full sample person weights that required trimming for 100% reported households. There are a large number of weights that require trimming because of the relatively high nonresponse rates and our ability to form cells that varied greatly in their nonresponse rates. The range of nonresponse rates among cells is good in that it permits reduction in the bias due to nonresponse, but it also leads to large adjustment factors for some cells and the subsequent need for weight trimming. The average adjustment factors for each category in the raking are provided in Appendix F. In addition, there were 71 weights trimmed because of very large weights due to the household being located in a different jurisdiction from where it was sampled.

## **5-C. PERSON TRIP WEIGHTS FOR TRAVEL DAY DATA**

Travel day person trip weights are simple functions of the person weights in section 5-B, modified only for the purpose of producing annual estimates of the number of trips. The "useable households travel day person trip weight" is simply equal to the final useable household person weight multiplied by 365. The 100%-reported-household travel day person trip weight is similarly calculated from the corresponding person weight.

## **5-D. TRAVEL PERIOD WEIGHTS**

### **5-D.1. HOUSEHOLD TRIP WEIGHTS FOR TRAVEL PERIOD**

Travel period household weights are simple functions of the household weights described in section 5-A, modified only for the purpose of producing annual estimates of the number of household trips. The "useable households travel period household weight" is simply equal to the final useable household weight multiplied by  $365/28$ . The 100-percent-reported-households travel period household weight is similarly calculated from the corresponding household weight.

### **5-D.2. PERSON TRIP WEIGHTS FOR TRAVEL PERIOD**

Travel period person weights are simple functions of the person weights described in section 5-B, modified only for the purpose of producing annual estimates of the number of person trips. The "useable households travel period person weight" is simply equal to the final useable household person weight multiplied by  $365/28$ . The 100-percent-reported-households travel period person weight is similarly calculated from the corresponding person weight.

## **5-E. DISTRIBUTION OF NUMBER OF TRAVEL PERIOD TRIPS**

The data in this file cannot be used in a simple manner to produce realistic distributions of households or persons by number of annual trips. The survey provides the number of trips taken in a 28-day period. Thus, for example, if a person reports taking two long distance trips in the 28-day travel period, we have no direct knowledge of how many trips the person takes in a year. A simple estimate of number of annual trips is  $2 * 365 / 28 = 26$ , but of course it is quite likely that the person will have taken fewer trips than this in a year. Similarly, if a person reports taking zero long distance trips in the 28-day travel period, a simple estimate of number of annual trips is also zero, but of course it is quite possible that the person will have taken a few trips during the year.

## **CHAPTER 6. DESCRIPTION OF DATA FILES**

### **6-A. STRUCTURE OF THE DATA FILES**

#### **6-A.1. BASIC STRUCTURE**

The 2001 NHTS Public Use Data, January 2004 release (Version 3) is organized into four different data files, which are available to users in SAS, ASCII, or DBF formats. Exhibit 6-1 illustrates the structure of the four files, with a description of which data are included in each file, the applicable questionnaire sections, the record level, and the variables that are needed to uniquely identify a record (ID variables).

The file variables are identified by the variable name in the SAS versions. For each file variable, the codebook (Appendix B) contains:

- the variable type & length,
- whether the variable was identical to one on the 1995 NPTS dataset,
- the label, which is a brief description of the variable content,
- the section and item number of the questionnaire or other source of the data,
- value ranges and special codes,
- the unweighted frequency of responses for each value or code shown, and
- the weighted frequency of responses for each value or code shown.

For each of the delivery files, Appendix C provides the SAS Proc Contents, the ASCII file layout and the dBase IV file layout. The Appendix displays the name, label, starting position and length of each variable.

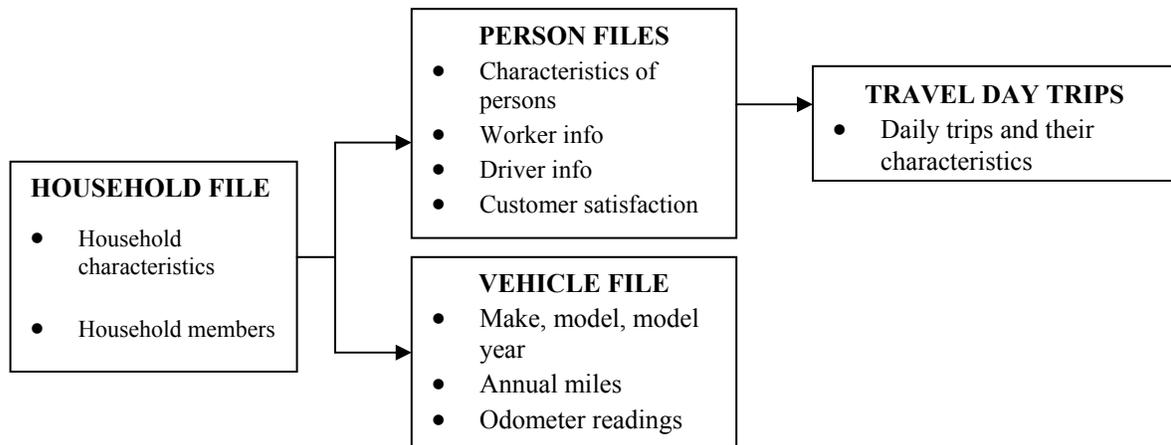

**Exhibit 6-1. Structure of 2001 NHTS January 2004 (Version 3) Data Files**

<b>Data Files</b>	<b>Information Included</b>	<b>Record Level</b>	<b>ID Variables</b>	<b>Weight Variables<sup>1</sup></b>
<b>House hold file</b>	Data unique to a household, or questions asked once for each sample household. Questions from interview sections: B Number of vehicles C Person Data, Telephone Data, Type of Residence, D Location of Home, M Household Income, Education of Household Respondent.	One record per household	HOUSEID	WTHHFIN WTHHNTL EXPFLHLLH EXPFLHLLH EXPINTHH EXPSCRHH
<b>Person file</b>	Data determined once for each completed person interview. Questions from interview sections: C Age, Race, Driver Status, E Travel to Work, L Miles driven, Customer Satisfaction, M Country of Birth, Education, Person Income, Medical Condition, Internet Use.	One record per person	HOUSEID and PERSONID	WTPERFIN WTPRNTL EXPFLPR EXPFLPRN EXPINTPR
<b>Vehicle file</b>	Data relating to each of the household's vehicles. Questions from interview sections: B Vehicle Data, C Race of Respondent, Type of Residence, L Verified Vehicle Data, Annualized Vehicle Miles, M Education of Respondent, Household Income.	One record per vehicle	VHCASEID	WTHHFIN WTHHNTL EXPFLHLLH EXPFLHLLH
<b>Travel day trip file</b>	Data about each trip the person made on the household's randomly-assigned travel day. Questions from interview sections: C Person Data, G Travel Day Data.	One record per travel day person trip	HOUSEID, PERSONID, and TDTRPNUM	WTTRDFIN WTTRDNTL EXPFLLLTD EXPFLLLTDN

<sup>1</sup> Chapter 7 provides a description of each of the weights.

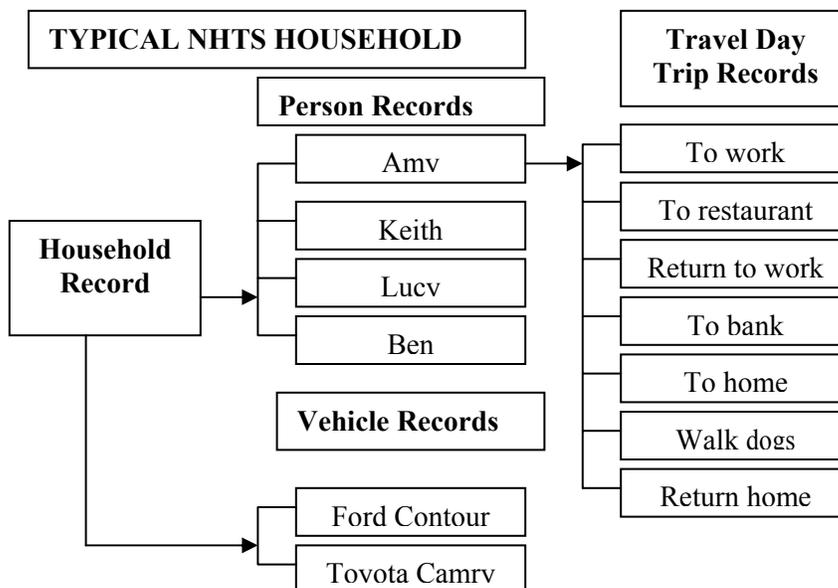

## 6-B. RELATIONSHIP BETWEEN THE FOUR NHTS DATA FILES

The chart below depicts the four 2001 NHTS Version 3 data files and their relationship.

### 6-B.1. TYPICAL NHTS HOUSEHOLD

The next chart shows how the records would appear for the data reported by the Typical NHTS Household example introduced in Chapters 1 and 2. Remember that this example household reported only a portion of what would have been reported in an actual NHTS interview.

Note: This follows the Typical NHTS Household material in Chapter 2. In a real household there would probably be trips by each household member; not just by Amy

## 6-B.2. WHEN IS A RECORD ON THE FILE

The purpose of this subsection is to present information to clarify the NHTS file structure issues that have been confusing to data users in the past.

**Household Record** - There is one record for each household in the dataset, also called a “useable” household<sup>2</sup>.

**Vehicle Record** - There is a vehicle record for each vehicle owned, leased or available for regular use by the household members in a useable household. If the household has no vehicles, there are no vehicle records. The number of household vehicles, including zero vehicles, is available on the household record in the variable, HHVEHCNT.

**Person Record** - There is a person record for each household member who completed a person interview. For example, in our Typical NHTS Household there are four household members. Person interviews were completed for Amy, Lucy and Ben. However, Keith was never available, despite repeated attempts during the six-day travel window. There is a person record for Amy, Lucy and Ben. No person record exists for Keith, but his characteristics, provided by Amy during the household interview, are available to the analyst on the household file (see Section 6-B.3. Household Member Variables).

**Travel Day Trip Record** - There is a trip record for each trip taken by an interviewed person in a useable household. In Chapter 2, we described the seven trips Amy made in our Typical NHTS Household. Since she made seven trips, there are seven travel day trip records on the file for Amy. If Lucy was ill and stayed home all day there would be no travel day trip records for Lucy, however, there is a person record for her, since she was interviewed. The person file variable, SAMEPLC, i.e. “stayed in the same place all day” would confirm that Lucy was interviewed for travel day and reported no trips. No travel day trip records exist for Keith, since he was not interviewed. Likewise, there is no person file record for Keith.

---

<sup>2</sup> A useable household is one where at least 50 percent of the adult household members have completed a person interview.

In earlier NHTSs, before “stayed in same place all day” was asked, data users assumed that the lack of a travel day trip record for Lucy meant that she was not interviewed for her travel day travel. This was not true for the 1990, 1995, and 2001 surveys. If there is a person record for that person, they were interviewed for the details of their travel day. Note that about 12 percent of the 160,758 persons in useable households in the 2001 NHTS reported no travel day trips. Not surprisingly, more of the stay at home days fall on a weekend. Of all persons who did not make a trip on their travel day, 19.9 percent had Saturday as their travel day and 16.8 percent had Sunday. While some of these non-travelling people may be “soft refusals” who did not want to bother reporting their trips, many of them are legitimate non-travelers. Remember that the NHTS travel days encompass all 365 days of the year, including holidays and weekends.

### **6-B.3. HOUSEHOLD MEMBER VARIABLES**

For the 2001 NHTS, the characteristics of all household members, whether interviewed or not, are available on the Household File. These characteristics were included to allow the user to address a number of travel behavior and survey method research issues. They provide the full profile of the household and allow users to know the characteristics of those household members who completed the person interview and those who did not. The characteristics are contained in variable names that end with P1 through P14 which is the maximum number of household members in a 2001 NHTS household. The information provided for each household member includes:

- Age (AGE\_P1 through AGE\_P14),
- Driver status (DRV\_P1 through DRV\_P14),
- Relationship to Household Respondent (REL\_P1 through REL\_P14),
- Sex (SEX\_P1 through SEX\_P14),
- Person interview response status, i.e., whether a person interview was completed, etc. (STAT\_P1 through STAT\_P14), and
- Worker status (WKR\_P1 through WKR\_P14).

## **6-C. CODEBOOK**

### **6-C.1. CODEBOOK FORMAT**

Appendix B contains the codebook with sections for each of the data files. The codebook contains nine items of information about each variable in each of the files. Exhibit 6-2 lists the items that are arranged in the codebook as columns, along with a brief description of the contents of each column. Appendix D, Derived Variables provides additional detail on how each of the derived variables in the codebook was calculated.

### **6-C.2. CODEBOOK EXAMPLE**

As an example, the third column of Exhibit 6-2 shows the codebook information for the variable named VEHOWNMO.

- It is a numeric variable of length eight including the decimal point. The decimal point position is not fixed. The format for the variable in SAS is 6.2 (up to three digits before the decimal point and two after). Formats for each variable are provided in Appendix A, Data Dictionary;
- This is a derived variable (denoted by an \* to the right of the question number). The variable it was derived from was not asked the same way in the 1995 NPTS;
- The variable contains the length of time the vehicle was owned converted to months. It is derived from question L8. The reported length of time the vehicle was owned (days, weeks, months or years) was converted to months based on the questionnaire variable OWNUNIT (question L8) (which is not included in the dataset).
- The value range and the frequencies show that the file contains 21,005 reports ranging from 0 to 11.7 months; that there were no subjects who did not know the distance, and none refused to answer the question. It also shows that the question was legitimately skipped for 118,366 subjects. Another 11 subjects had a value of not ascertained in the field; and
- Further details regarding this variable are found in Appendix D.

**Exhibit 6-2. Contents of the 2001 NHTS Codebook**

<b>Column Heading</b>	<b>Description of Contents</b>	<b>Example Variable (From Person File)</b>
Target Variable	The variable name	VEHOWNMO
Variable Type	C = Character; N = Numeric	N
Variable Length	Maximum variable length	8
1995 Variable Comparison	Y Identical to 1995 NR Response categories are different NQ Question is different NQR No match with 1995 SD Some difference in the derived variable X Derived variable did not exist in 1995	NQR
Variable Label	Short description of the variable	How long vehicle owned - months
Question Number	Source item(s) in the questionnaire section	L8*
Value Range & Codes	Either lists all possible values of the variable, a range of the values, or a combination of the two	0 – 11.7 -1 = Legitimate skip -7 = Refused -8 = Don't know -9 = Not ascertained
Unweighted Frequencies	Shows the number of records in the file for each listed value	0 – 11.7 = 21,005 -1 = 118,366 -7 = 0 -8 = 0 -9 = 11

**Exhibit 6-2. Contents of the 2001 NHTS Codebook (continued)**

Column Heading	Description of Contents	Example Variable (From Person File)
Weighted Frequencies	Shows the corresponding weight for each listed value for the variable	$0 - 11.7 = 30,542,988$ $-1 = 172,023,762$ $-7 = 0$ $-8 = 0$ $-9 = 19,450$
Footnote	Refers the user to other sections of the User's Guide for more information	Refer to Appendix D for more detail on derived variables

**6-C.3. COMPARABILITY WITH 1995 NHTS**

Emphasis was placed on making the 2001 NHTS data files comparable to the 1995 NPTS data files. We compared each of the questions in the 1995 NPTS with those in the 2001 NHTS. The fourth column in the codebook, 1995 Variable Comparison, provides a code that compares the questions and the response categories under each question in the 1995 and 2001 surveys. When comparing data values in variables across surveys, we recommend data users pay attention to the codes in this column irrespective of whether the variable names are identical in the two surveys. If the code indicates that the questions were identical, then the values can be compared with no adjustments. However, if questions were different, adjustments are recommended when comparing results across survey years. The codes in the column are:

- Y (Identical to 1995) Indicates that the 1995 and 2001 questions were identical. That is, both the wording of the question and the response categories were identical,
- NR (Response Categories are Different) Indicates that the wording of the questions were identical to 1995 but the response categories were different,
- NQ (Question is Different) Indicates that the response categories were identical to 1995 but the wording of the question was different,

NQR (No match with 1995) Indicates both the wording and response categories were different,

SD (Some difference in the Derived Variable) Indicates the variable was derived and that the derived variable is not identical to the one in 1995, and

X (Derived Variable did not exist in 1995) Indicates the variable was derived and did not exist in 1995.

#### **6-D. VARIABLES REPEATED**

In addition to the information specific to its file, each of the four files includes variables from other files to be used along with its own variables (e.g., the travel day file contains data on the individual travel day trips). This is done for the convenience of the data user to minimize the need to merge data from multiple files. Although this format is less desirable from a data storage standpoint, it significantly simplifies subsequent data manipulation.

On the following page we list the commonly used variables that have been included in all four data files:

<b>Variable Name</b>	<b>Label</b>
CDIVMSAR	HHs by Census div., MSA size, rail
CENSUS_D	Household Census Division
CENSUS_R	Household Census Region
DRVRCNT	Count of drivers in HH
HBHRESDN	Housing units per sq mile - Block group
HBHTNRNT	Percent renter-occupied - Block group
HBHUR	Urban / Rural indicator - Block group
HBPPOPDN	Population per sq mile - Block group
HHC_MSA	MSA / CMSA code for HH
HHFAMINC	Total HH income last 12 months
HHINCTTL	Total income all HH members
HHR_HISP	Hispanic status of HH respondent
HHR_RACE	Race of HH respondent
HHSIZE	Count of HH members
HHSTATE	State-household location
HHSTFIPS	FIPS state code for HH
HHVEHCNT	Count of HH vehicles
HOMEOWN	Housing unit owned or rented
HOMETYPE	Type of housing unit
HOUSEID	HH Identification Number
HTEEMPDN	Jobs per sq mile - Tract level
HTHRESDN	Housing units per sq mile - Tract level
HTHTNRNT	Percent renter-occupied - Tract level
HTHUR	Urban / Rural indicator - Tract level
HTPPOPDN	Population per sq mile - Tract level
LANG	Language interview was conducted in
LIF_CYC	HH life cycle
MSACAT	MSA category
MSASIZE	Population size of HH MSA
NUMADLT	Number of adults in HH
RAIL	Rail (subway) category
SMPLAREA	Add-on area where HH resides
SMPLFIRM	Firm collecting the data
SMPLSRCE	Sample where the case originated
TDAYDAT2	Travel day date (YYYYMMDD)
TDAYDATE	Travel day date (YYYYMM)
TDBOA911	Travel Day Before or On/After 9/11
TRAVDAY	Travel day - day of week
URBAN	Household in urbanized area
URBRUR	Household in urban/rural area
WRKCOUNT	Count of HH members with jobs

## **6-E. DERIVED VARIABLES**

Over 239 derived variables were created during the development of the four public use and DOT research files released in January 2004 for the 2001 survey. These exclude variables created for the travel period and most recent research files for DOT. These variables are included in Appendix D, Derived Variables. The Appendix provides documentation on how each of the variables was derived. These variables are considered derived as they do not appear in the questionnaires included in Appendix M and therefore no data was stored in these variables during data collection. The variables were derived by:

- renaming a questionnaire variable to match names used during the 1995 survey or new names provided by DOT,
- calculating the variable from one or more variables in the questionnaires to provide summary variables to aid data users,
- obtaining the variable from external sources to provide additional descriptors, or
- creating flag variables to identify data records that had been edited or imputed.

Among the derived variables are eight variables that concern the estimation of annualized mileage for each household vehicle. These variables were derived by Oak Ridge National Laboratories using NHTS survey data and are described in detail in Appendix J – Methods to Estimate Annual Miles Driven per Vehicle.

The U.S. Energy Information Administration provided ten other derived variables that estimate the vehicle fuel economy, vehicle fuel consumption, and vehicle fuel expenditures. These were derived from data from the 2001 National Household Travel Survey (NHTS); the U.S. Energy Information Administration (EIA) 1985, 1988, and 1991 Residential Transportation Energy Consumption Survey (RTECS); the U.S. Environmental Protection Agency (EPA) fuel economy test results; and the EIA's retail pump price series for 2001 and 2002. The details of these variables are presented in Appendix K, Estimation Methodologies for Fuel Economy and Fuel Cost.

Nine additional derived variables were added to describe the characteristics of the areas where the NHTS survey respondents live. These variables were derived from 2000 Census data and estimated forward to 2002-2002 by Claritas, Inc. Details of these variables are presented in Appendix Q, Tract and Block Group Variables.

#### **6-E.1. 1990 TRAVEL DAY TRIP PURPOSES**

The travel day trip purpose definitions for the 2001 NHTS differed from those used in the 1990 and 1995 NPTS. The recoded 1990 trip purposes will be particularly useful for analyses comparing the 1990, 1995 and 2001 data by purpose. For each travel day trip, the data set includes both variables that provide the 2001 trip purpose and the derived 1990 trip purpose. The 1990 trip purpose was calculated by recoding the 2001 trip purpose to match the way trip purposes were collected during the 1990 NPTS. This recoded 1990 trip purpose is stored in the variable WHYTRP90.

The 2001 trip purposes use a “from-to” format, while the 1990 purposes were based on coding a “main reason” for the trip. As a result, the trip purpose codes used in 2001 differed from the 1990 trip purposes in the following ways:

- A trip "to home" after completing an activity is categorized as "return home" in 2001 purposes but was not a 1990 trip purpose. In 1990, the trip purpose was assigned to the activity that was the main reason the subject was away from home,
- In 1990, if one of the purposes was work, the return trip home was assigned a work purpose, even if there were incidental trips made on the way home,
- In 1990, if there were multiple purposes for being away from home and work was not one of them, the respondent was asked the main reason for the trips. Because this “main reason” format was not used in the 2001 survey, when the 2001 purposes were recoded to the 1990 scheme, the activity the person spent the most time at while away from home was assigned as the main purpose for the return trip home. The variable, DWELTIME, was used to determine this.

## **CHAPTER 7. USING THE DATA**

### **7-A. TRAVEL CONCEPTS**

#### **7-A.1. OVERVIEW**

Appendix E provides abbreviations used in this report, key travel concepts and a glossary of terms used in the 2001 NHTS. The Travel Concepts portion of Appendix E is primarily geared toward data users who are not familiar with household travel survey data. However, it may also be useful to the transportation planning professional because the use of certain travel terms and concepts often vary by individual survey. Appendix E contains definitions of the following measures of personal travel, when to use each, and how to compute them with the NHTS data:

- Person Trips
- Person Miles of Travel (PMT)
- Vehicle Trips
- Vehicle Miles of Travel (VMT)
- Vehicle Occupancy

### **7-B. TABULATING THE DATA**

#### **7-B.1. SAMPLE TABLES AND LOGIC**

Appendix G contains 12 sample tables that provide tabulations of some of the most commonly used variables. Tables were chosen to illustrate the national-level estimates that would be tabulated by many data users, such as:

- total households by income and vehicle ownership patterns,
- total persons by age, race and gender,
- total numbers of workers, drivers, person trips, person miles, vehicle trips, and vehicle miles, and

- vehicle occupancy and commute time tabulations.

Each cell of each of the tables contains the:

- sample size
- weighted estimate, and
- sampling error of each weighted estimate.

These tables were prepared using the WesVar survey data analysis software developed by Westat.

## **7-B.2. ADDITIONAL RESOURCES**

**NHTS Website** - <http://nhts.ornl.gov/2001>

The NHTS Website offers:

- analysis capability which will include production of user-defined tables,
- a component for exploratory analysis of the data,
- a number of standard NHTS tables,
- a conference portion to allow the data user to communicate with others, share code, etc., and
- papers and articles analyzing the NHTS data.

NHTS Training - FHWA and BTS are developing an interactive CD-ROM as a stand-alone training tool. This will allow individuals to obtain training that fits with their needs.

Contact information for user support:

Statistical Issues	Lee Giesbrecht, BTS (202) 366-2546

## **7-C. CONTROL NUMBERS**

Control totals and weight sums, which are the two most useful control numbers are described briefly below.

### **7-C.1. CONTROL TOTALS**

Control totals are known values, external to the survey itself, which are used to adjust the survey weights for non-response and non-coverage. Control totals were used to adjust the 2001 NHTS weights for:

- the number of U.S. households, and
- the number of persons in these households.

The control categories chosen for the 2001 NHTS and the weighting procedure are described in Chapter 5 of this User's Guide. Appendix F contains the full complement of Control numbers for the 2001 NHTS data set. The variables used to define nonresponse adjustment cells are in Appendix H.

## 7-C.2. WEIGHT SUMS

Weight sums are simply the calculated sums of the survey weights. These values are helpful to users in verifying the correctness of data tabulations. The 2001 NHTS total sample sizes and weight sums for the four data files are in Table 7-1. A full set of sample sizes and weight sums that can be used for checking output are contained in Appendix F, Table 3.

**Table 7-1. File Sample Sizes and Weight Sums**

<b>Data File</b>	<b>Sample Size</b>	<b>Weight Sum</b>
Household	69,817	107,365,346
Person	160,758	277,203,235
Vehicle	139,382	202,586,200
Travel day person trips	642,292	407,262,485,207

## 7-D. WEIGHTING THE DATA

### 7-D.1. WHY USE WEIGHTS

Chapter 5 described how the weights were calculated for the 2001 survey. The weights reflect the selection probabilities and adjustments to account for nonresponse, undercoverage, and multiple telephones in a household. To obtain estimates that are minimally biased, weights must be used. Tabulations without weights may be significantly different than weighted estimates and may be subject to large bias. Estimates of the totals are obtained by multiplying each data value by the appropriate weight and summing the results.

## 7-D.2. WHICH WEIGHT TO USE

There are several different weights, and it is important that the appropriate weight is used for a particular estimate. There are sets of weights for the full sample and for the national-only sample. For each set, there are household weights, person weights, travel day and travel period weights. Travel Period data have not been included in the January 2004 release of the data, but will be released later in the year by BTS.

- Compared to national-only weights, full sample weights have the advantage of being based on a larger sample size and therefore produce estimates with lower sampling errors. Since the additional sample is largely concentrated in some small population geographic areas, the sampling errors are not reduced very much for most national estimates. For sub-national estimates specifically for an add-on area or an area that is only a little larger than an add-on area, the sampling errors will be much smaller for the full sample weights and therefore should be used.
- Response rates were significantly higher for the national sample than for most of the add-on sample areas. Thus, there is potentially higher bias in estimates based on the full sample than on the national-only sample. Estimates for small subgroups tend to have large relative sampling errors and thus any bias due to nonresponse is likely to be small compared to the sampling error. For such estimates, it is preferable to use full sample weights. For most estimates, however, bias may be large compared to sampling error, and thus it may be preferable to use the national sample.
- Household weights are used whenever one is tabulating an estimate at the household level as opposed to the person level, such as number of households by household vehicle ownership and distribution of households by number of household drivers.
- Travel day weights are used for estimates involving numbers of trips or miles of travel, for example, number of vehicle trips by trip purpose. Only trips in personally owned vehicles that are reported by the driver should be counted in estimating personal vehicle trips. (For example, if a person reports being a passenger in a vehicle driven by another member of the household, that trip would not be counted.)
- Travel period weights are used for estimates involving numbers of trips or miles of travel for trips of more than 50 miles as obtained for the 28-day travel period. The travel period household weight is used for estimates of household trips, and the travel period person weight is used for estimates of person trips.

- Person weights are used for all other estimates (i.e., for non-household and non-travel day items of interest).

Note that for some estimates requiring ratios, different weights should be used for the numerators than for the denominators. For example, for estimates of daily trips per household, travel day weights are used for the numerator (since the numerator involves person trips) and household weights are used for the denominator (since the denominator is the weighted number of households). As a second example, for estimates of average time spent driving by all drivers, travel day weights are used for the numerator and person weights are used for the denominator (since drivers are a subset of persons).

Table 7-2 gives the variable names for full sample weights, and Table 7-3 gives the variable names for national weights.

### **7-D.3. WHICH HOUSEHOLD WEIGHT TO USE**

There are two different household weights as shown in Table 7-2 and in Table 7-3. If one wishes to use those households for which there were completed interviews for at least half of the adults, the useable household weight should be used. If one wishes to use only those households for which there were completed interviews with all adults in the household, the 100 percent reported weight should be used. Finally, there are two different travel period (household) weights that differ from the household weights only in that they have a multiplier of 365/28.

### **7-D.4. WHICH PERSON AND TRAVEL DAY WEIGHT TO USE**

There are also two different person weights, one for persons interviewed in useable households and one for persons interviewed in 100 percent reported households. Table 7-2 and Table 7-3 provide variable names for both weights. There are two different travel day weights that differ from the person weights only in that they have a multiplier of 365. Finally, there are two different travel period person weights that differ from the person weights only in that they have a multiplier of 365/28.

Tables 7-2 and 7-3 provide the variable names for the weights and the replicate weights. Section 7-E, Source of Errors discusses how they may be used to estimate sampling errors.

**Table 7-2. Description of the Different Full Sample Weights on the 2001 NHTS**

		Household	Person	Travel day person
Useable Households	Weight	WTHHFIN	WTPERFIN	WTTRDFIN
	Replicates	WTHFIN1-99	WTPFIN1-99	WTDFIN1-99
100% Reported Households	Weight	EXPFLHHL	EXPFLHPR	EXPFLHLD
	Replicates	EXPFLH1-99	EXPFLHPR1-99	EXPFLHLD1-99

**Table 7-3. Description of the Different National Weights on the 2001 NHTS**

		Household	Person	Travel day person	Travel period household	Travel period person
Useable Households	Weight	WTHHNTL	WTPRNTL	WTTRDNTL	WTTRPNTL	WTPTPFIN
	Replicates	FHHWT01-99	FPERWT01-99	FTRDWT01-99	FHTPWT01-99	FPTPWT01-99
100% Reported Households	Weight	EXPFLHHN	EXPFLHPRN	EXPFLHLDN	EXPFLHPTN	EXPFLHPTP
	Replicates	EHHWT01-99	EPERWT01-99	ETRDWT01-99	EHTPWT01-99	EPTPWT01-99

## 7-E. SOURCE OF ERRORS

### 7-E.1. SAMPLING ERRORS

Since every person and household in the U.S. were not included in this survey, the sample estimate may differ from the result that would have been obtained if a census were conducted under the exact same circumstances. Calculating sampling errors provides the basis for measurement of the variability in the estimated statistics,

and allows analysts to make probability statements about how large the difference may be between an estimated sample statistic and what would have been obtained for that statistic had a census been conducted.

The replicate weights that use the full sample variable names given in Table 7-2 as prefixes may be used to calculate standard errors. The idea in replicate variance estimation is that sample estimates are made for a number of subsamples of the fully conducted survey. One then looks at the difference between each replicate sample estimate and the full sample estimate and squares the difference. Finally, one sums up the squared differences across all the replicates, with an appropriate multiplicative factor.

The replicate weights were calculated using the delete-one Jackknife method<sup>9</sup>. These weights can be used to calculate standard error estimates using WesVar or SUDAAN. Standard error estimates can also be easily calculated using the following formula:

$$\sqrt{\frac{98}{99} \sum_{i=1}^{99} [REP(i) - x]^2}$$

where  $x$  is the full sample estimate (calculated by using the full sample weights) and  $REP(i)$  is the estimate calculated by using the replicate weights and the summation over the index  $i$  is from 1 to 99. For example, suppose one is interested in an estimate of persons for Option 1 using the full sample. The weight WTHHFIN is used to calculate the overall estimate  $x$ . The weight WTHHFIN1 is used to calculate the estimate  $REP(1)$ , the weight WTHHFIN2 is used to calculate the estimate  $REP(2)$ , etc. Replicate weights are provided only for households and persons. For vehicles, use the household replicate weights. For travel day trips, use the person weight times 365. For travel period trips, use the person weight times 365/28.

As an example of the use of standard errors, the weighted survey estimate of household vehicles is 202,586,200 with an estimated standard error of 672,072. This standard error estimate allows one to conclude with 95% confidence probability that the interval 201,242,056 to 203,930,344 contains the estimated number of household

---

<sup>9</sup> Wolter, KM. (1985) *Introduction to Variance Estimation*. New York: Springer-Verlag

vehicles that would have been obtained if a census were conducted using the same procedures.

## **7-E.2. NONSAMPLING ERRORS**

There are many sources of error in addition to error occurring because only a sample was selected. Some examples of nonsampling include:

- A respondent misunderstands a question and answers it incorrectly,
- A respondent does not recall a trip or remembers details of the trip incorrectly,
- An interviewer does not correctly record what the respondent says,
- A person or household is a nonrespondent, and
- A person does not answer a specific question.

Undercoverage may also be a source of error. Undercoverage occurs for several reasons, including that a household has no telephone, a person states incorrectly that the telephone number we have dialed is not residential, and the household respondent either accidentally or purposely does not report all the people living in the household.

Note that nonsampling error can sometimes be much larger than sampling error. Furthermore, for this survey good estimates of sampling error are possible but, as in most surveys, it is impossible to estimate nonsampling error.

## **7-F. FINDING THE VARIABLES YOU WANT**

### **VARIABLE LISTS**

The 2001 NHTS datasets are large and complex, containing numerous survey and external (derived) variables. In addition to the codebook for each of the four NHTS data files, the following variable lists are available to assist users in locating NHTS variables:

1. SAS Proc Contents - Appendix C contains SAS proc contents lists for each of the four NHTS data files. The survey variables are listed in alphabetic order on each of these four listings.
2. ASCII File Variable Lists - Appendix C also contains the list of each ASCII variable, with its position and length on each of the four files. The ASCII variables for each NHTS file are ordered as follows:
  - First: ID and weight variables,
  - Second: questionnaire variables in order by question number, and
  - Last: all stratification variables, computed or derived variables and external variables.
3. Data Dictionary Listing - This list shows all of the variables that are contained in all four 2001 NHTS data files in a single alphabetic listing. Since many variables are in more than one file, the data dictionary list has four columns indicating which data files contain each of the variables. The data dictionary is Appendix A.

## **7-G. USING THE DATA FROM MULTIPLE FILES**

### **7-G.1. MERGING FILES**

Despite the effort to include often used variables on multiple files (see Section 6-D), there still comes a time when it is necessary to use information from separate files for an analysis. For example, to study the daily trip patterns of different types of privately-owned vehicles (POVs), one needs to use the variable VEHTYPE (vehicle type) from the Vehicle file and link it to trip characteristics maintained in the Travel Day file. In these types of circumstances, one needs to merge together two or more of the four files.

File merging can be complicated and confusing, and a mistake can lead to invalid analysis results. However, an understanding of how the four files are structured and relate to each other can significantly help clarify the process.

## 7-G.2. ID NUMBERS

Each unit (e.g. households, persons) in the survey has its unique identification number (ID). Specifically, each household is identified by a unique nine digit household ID (HOUSEID). Within each household, household members are identified by a two digit person number (PERSONID) and, similarly, household vehicles are identified by a two digit vehicle number (VEHID). Again, trips taken by an individual are numbered by a trip number (TDTRPNUM for a travel day trip and TPTRPNUM for a travel period trip).

With this numbering system, the number that identifies a unit within a household (e.g., the household's vehicles and household members) needs to be used in conjunction with the household ID to uniquely identify that unit. For example, if a household has a HOUSEID of 123456789, its first member has a PERSONID of 01, and its second member has a PERSONID of 02, then the first household member is uniquely identified by an ID of 12345678901 and the second member 12345678902.

Similarly, the number that identifies a trip taken by an individual needs to be used in conjunction with the person's unique ID (i.e., HOUSEID and PERSONID) to uniquely identify that trip.

Continuing the above example, assume that the first household member took three travel day trips on the assigned travel day. Thus, TDTRPNUM for the first trip is 01, the second trip 02 and the third trip 03. An ID of 1234567890101 will uniquely identify the first trip taken by the first household member of Household 123456789. Likewise, an ID of 1234567890102 and an ID of 1234567890103 will uniquely identify the second and the third trips taken by the same person, respectively. The third trip ID is represented as:

$$\text{HOUSEID} + \text{PERSONID} + \text{TDTRPNUM} = \{123456789\}\{01\}\{03\}$$

Table 7-4 shows which ID variables to use in the most common data linking of any two data files. Note that the linking ID must be common to both the "from" and "to" files. For example, in linking Person file data with Travel Day trip data, the variable TDTRPNUM would not be used because it is only on the Travel Day file, not on the Person file.

**Table 7-4. Examples of Link Variables Between the Four 2001 NHTS Data Files**

<b>From File 1</b>	<b>To File 2</b>	<b>Linking ID Variables</b>
Household file	Person file	HOUSEID
Household file	Vehicle file	HOUSEID
Household file	Travel day trip file	HOUSEID
Person file	Vehicle file	HOUSEID
Person file	Travel day file	HOUSEID and PERSONID
Vehicle file	Travel day file	HOUSEID

### **7-G.3. ID VARIABLES NOT ALWAYS SEQUENTIAL**

The ID variables within a file are not always sequential. There are a number of reasons for this. Examples explaining these reasons were provided in Section 3-D, Data Editing. Some of the reasons why the numbers are not sequential are:

- Some persons and vehicles reported by the household respondent were later found not to belong with the household and were deleted from the data set,
- Some trip segments reported as separate trips were combined during editing, and
- Some trip segments reported as a single trip were split into two.

### **7-G.4. MERGING DATA FILES**

Depending on the nature of the analysis, merging files is typically based on a variable common to the files. The file-merging approach is illustrated here using an example. In this example, the user wants to analyze the impact, if any, of occasional telecommuting on the number of daily trips. The trip-making data are contained in the Travel Day file while the variable indicating occasional telecommuting is in the Person file (WKFMHM2M). That is, the Travel-day file needs to be merged with the Person file.

The variables HOUSEID and PERSONID combined enable one to use the Person file to identify those who occasionally telecommute and those who do not. Using the combined identification number for HOUSEID and PERSONID, one can identify trips taken by that person in the Travel Day file. In this case, HOUSEID and PERSONID combined is the common identification needed to merge the Travel Day and Person files.

In layman's language, the computer is first instructed to "grab" the variable WKFMHM2M, which holds the data on whether the respondent occasionally telecommutes, along with the associated HOUSEID and PERSONID variables from the Person file. Next, the computer is instructed to identify from the Travel Day file all trips that are taken by that person. That is, having the same combined HOUSEID and PERSONID identification number.

Finally, the computer is told to "match" information on occasional telecommuting to the travel day trips based on the combined HOUSEID and PERSONID identification number.

After the files are successfully merged, the next question in using the merged file is which weighting factor to use. Section 7-D provides details on the weights to use.

## **7-H. SPECIAL USER NOTES**

### **7-H.1. DATA FILE CONVENTIONS**

There are a number of conventions followed throughout the NHTS data files. Some of these are also listed in Appendix B, Codebook, and they include:

- Yes/No questions - coded as:
  - 1 = yes
  - 2 = no
- Calendar Dates - multiple variables contain these dates, usually the year and month are shown as follows:

- YYYYMM = year followed by the month
- Times - all reported time variables are in military time as:  
0000 to 2359
- Legitimate skip codes - questions intentionally skipped in the instrument were generally denoted by a -1 in the field.
- Don't know - when the respondent indicated that they did not know the response to a question it was denoted by an -8 in the field.
- Refused - when a respondent refused to provide a response to a question it was denoted by a -7 in the field.
- Not ascertained - When a question should have been asked of the respondent but was not (the question was not a legitimate skip (code -1) for that respondent) or the response provided did not seem correct because it failed an edit check and could not be corrected, the response was set to not ascertained. A not ascertained is denoted by a -9 in the field.
- Missing information for derived variables - Variables in the dataset that were derived from one or more other variables are listed in Appendix G.
  - If a derived variable was derived from just one primary variable, the missing values for the derived variable are identical to the primary variable and could be -1, -7, -8 or -9.
  - If the derived variable was derived from multiple variables, the missing values for the derived variable are -1 or -9. That is, responses of -7, or -8 were set to -9.
  - If the derived variable is not derived from a CATI variable, for example, the weight variables, then missing values are coded as follows:  
 . = missing value for a numeric derived variable  
 Blank = missing value for a character derived variable
- Survey weights - there are two weight variable on each file. Section 7-D provides guidance on which weight to use.

## **APPENDIX A**

### **2001 NHTS DATA DICTIONARY**

The 2001 NHTS is a large, complex data set, with hundreds of variables contained in four files. For ease in running tabulations and analyzing the data, a number of the variables are repeated on several files. The data dictionary contained in this Appendix is designed to assist the data user in finding the variables they need and the files in which the variables are located. It also helps in placing a variable in context when all that is known is the variable name.

The data dictionary is a consolidated list of all 2001 NHTS variables in alphabetic order by variable name. It contains much of the information that is in the Codebook, such as source of the data (question number), 1995 NPTS variable comparison, 2001 variable name, variable type, variable length, variable format, a label describing the contents, and an indication of which file or files the variable is found on. Abbreviations used in this appendix are defined in Chapters 6 and 7 and in Appendix B.

# APPENDIX B

## 2001 NHTS CODEBOOK

This Appendix contains information on the variables in each of the five NHTS data files. The Household file codebook has been included first followed by the codebook for the Person, Vehicle, Travel Day and Travel Period Files.

For each variable the codebook provides:

<b>2001 Variable Name</b>	This is the variable name used in the 2001 NHTS
<b>Changed in V4?</b>	(Y=Yes, N=No) Indicates whether a variable has values that changed in the V4 revision, or was a variable newly created in V4
<b>Variable Type</b>	“N” indicates the data is numeric “C” indicates character (alphanumeric) data
<b>Variable Length</b>	This is the length of the variable including the decimal point. The format for the variable in SAS (are provided in Appendix A, Data Dictionary;
<b>1995 Variable Comparison</b>	Y (Identical to 1995) Indicates that the 1995 and 2001 questions were identical. That is, both the wording of the question and the response categories were identical, NR (Response Categories are Different) Indicates that the wording of the questions were identical to 1995 but the response categories were different, NQ (Question is Different) Indicates that the response categories were identical to 1995 but the wording of the question was different, NQR (No match with 1995) Indicates both the wording and response categories were different, SD (Some difference in the Derived Variable) Indicates the variable was derived and that the derived variable is not identical to the one in 1995, and X Indicates the variable was derived and did not exist in 1995.
<b>Label</b>	Provides a short description of the variable.
<b>Question Number</b>	Documents the survey question (see Questionnaire in Appendix J) that was the source of the data. For derived variables (see Appendix G), the question number is followed by an * to indicate that the variable was derived from more than one source.
<b>Value Range Code</b>	The legitimate data entries are identified. If special codes are used, they are also identified and defined.
<b>Frequency</b>	For each item identified in the column Value Range and Codes, the frequency of its occurrence in the sample is documented.
<b>Weighted Frequency</b>	Displays weighted frequencies for each item identified in the column Value Range and Codes.

## APPENDIX D

### DERIVED VARIABLES

This appendix contains variables in the codebooks for the public use and DOT research files that do not exist in the 2001 NHTS questionnaire included as Appendix M to this User's Guide. These variables were derived by:

- Simply renaming variables in the 2001 questionnaire so that the names correspond to those used in earlier NPTS Surveys. This group of variables have an \* following the variable name,
- combining one or more questionnaire variables into a single variable, or
- obtaining the variable from external sources other than the survey questionnaire.

We list each "derived" variable and for variables created by Westat, this Appendix describes how each was calculated. If the derived variable was derived from variables in the questionnaire, the description provides the name of the variable that was used to derive the new variable followed in parenthesis by the question number in the questionnaire where the variable is located. If the variable is derived from a variable not in the questionnaire (from another derived variable), the variable name is followed by the word "derived" in parenthesis.

For variables created by Oak Ridge National Laboratory (ORNL), Appendix J provides a description of how each was calculated. For more information on the variables provided by Energy Information Administration (EIA), please refer to Appendix K. Additional detail on variables created by Claritas is provided in Appendix Q.

1. AGE\_P1 to AGE\_P14\*: Age of each household member derived from AGE (C8). The P1, P2 etc. correspond to the last two digits of the person ID. In 1995 this variable was named P1\_AGE to P14\_AGE.
2. ANMLTYR: This variable is an annualized mile estimate for vehicles owned less than 1 year using ESTMILES (L10) as follows:  $(12 \times L10) / (L8 \text{ converted to months})$ . Do not include vehicles where L8 is -7, -8 or -9. If ESTMILES is -7 or -8, use ESTMILE2. The value of this variable has been capped at 200,000 miles in the public use file. In 1995 this variable was named ANNMILES.
3. ANNMILES: Annualized mile estimate for all vehicles as reported during the person interview.
  - If VEHOWNMO (derived) is 12 months or more, the annualized mileage is the miles reported in VEHMILES (L9), or VEHMILE2 (L9A). Use VEHMILE2 instead of VEHMILES if VEHMILES is -7 or -8. Use the mid-point of the range in VEHMILE2.
  - If VEHOWNMO is less than 12 months, use the annualized mileage estimate reported in ANMLTYR (derived).
  - If VEHOWNMO is -7, -8, or -9, ANNMILES should be -7, -8 or -9.
4. ANNUALZD: Annual miles estimates derived from the odometer readings. Variable provided by ORNL.
5. ANN\_FLG: Reasons for missing ANNUALZD value. Variable provided by ORNL.
6. ANULZDSE: Standard error of ANNUALZD estimate. Variable provided by ORNL.
7. BESTMILE: Estimated best estimate of annual miles this vehicle was driven derived by ORNL.
8. BEST\_EDT: Indicates BESTMILE was edited. Variable provided by ORNL.
9. BEST\_FLG: Indicates how BESTMILE was derived. Variable provided by ORNL.
10. BEST\_OUT: Indicates outlier values for BESTMILE. Variable provided by ORNL.
11. BTUCOST: Fuel cost estimated in units of cents per million British Thermal Units provided by EIA.
12. BTUTCOST: Total dollar cost of fuel per year derived from BTUCOST and BTUYEAR provided by EIA.
13. BTUYEAR: Estimate of the amount of million British Thermal Units consumed per

---

\* This derived variable was created by simply renaming the variable name in the 2001 questionnaire.

year. Provided by EIA.

14. CDIVMSAR: This variable is derived from variables CENSUS\_D and MSACAT. This represents the smallest geographic level that is appropriate for tabulations of the national sample data.
15. CENSUS\_D: The classification is derived from the geocode for the household's home address. The 2000 Census Division source used was [HTTP://WWW.CENSUS.GOV/GEO/WWW/COB/DV2000.HTML](http://www.census.gov/geo/www/COB/DV2000.html). The categories are:
  - 1 = New England (ME, NH, VT, CT, MA, RI)
  - 2 = Mid-Atlantic (NY, NJ, PA)
  - 3 = East North Central (IL, IN, MI, OH, WI)
  - 4 = West North Central (IA, KS, MO, MN, ND, NE, SD)
  - 5 = South Atlantic (DE, FL, GA, MD, NC, SC, WV, VA)
  - 6 = East South Central (AL, KY, MS, TN)
  - 7 = West South Central (AR, LA, OK, TX)
  - 8 = Mountain (AZ, CO, ID, MT, NM, NV, UT, WY)
  - 9 = Pacific ( AK, CA, HI, OR, WA)
16. CENSUS\_R: The classification is derived from the geocode for the household's home address. The 2000 Census Region source used was [HTTP://WWW.CENSUS.GOV/GEO/WWW/COB/RG2000.HTML](http://www.census.gov/geo/www/COB/RG2000.html). The categories are:
  - 1 = Northeast
  - 2 = Midwest
  - 3 = South
  - 4 = West
17. CNTTDHH: This variable is the sum of all Travel Day person trips enumerated (G12 through G14) by interviewed household members in useable households.
18. CNTTDTR: This variable is the sum of Travel Day person trips, including zero, made by this subject. It will include trips reported by this subject for which trip detail was obtained from another household member.
19. CNTTPHH: This variable is the sum of all Travel Period person trips enumerated (H1) by interviewed household members in useable households. For recurring trips where RECURR (H1) is 1 the count of trips is the number reported in NTIMES (H1). Do not include most recent trips. It is the sum of CNTTPTR for each household member.
20. CNTTPTR: This variable is the sum of Travel Period person trips, including zero, made by this subject. It will include trips reported by this subject for which trip detail was obtained from another household member.

21. CNTTPUNQ: The number of unique travel period trips for this respondent. If the subject has no recurring trips, it is the total number of travel period trips enumerated. If the subject has recurring trips (RECURR (H1)), count each recurring trip just once when calculating the total number of unique trips. Do not include most recent trips. Include trips reported by this subject for which trip detail was obtained from another household member.
22. COMMDRVR\*: This variable is 1 if WRKDRIVE (E8) is 1.
23. COMMOCC\*: The variable is obtained from OCCUPATN (E9).
24. DIARYCMP: Indicates whether the travel day diary was completed. Derived by combining categories 2 and 3 in question (G2) into category 2.
25. DIFFDATE: Variable calculated by subtracting the date of the travel day from the date the subject completed the person interview.
26. DISTBLOC: The one way distance from home to work, if reported in blocks. If DISTUNIT (E14) = 1 (blocks), then the number of blocks from (E14) is in DISTBLOC. If DISTTOWK (E14) is 996, set DISTBLOC to 1.
27. DISTTOWK: The one way distance from home to work reported in or converted to miles. The variable is derived from DISTTOWK (E14) and DISTUNIT (E14). If DISTUNIT (E14) is 1 (blocks), then the number of blocks is converted to miles using the equation 9 blocks = 1 mile. If already reported in miles, use the number of miles reported. If DISTTOWK (E14) is 996, set 996 to 0.1. If DISTTOWK (E14) is 997, set 997 to 0.25.
28. DRIVER: Driver status of subject. If DRVR (C8), DRIVER (C13), or WRKDRIVE (E8) is 1, or if the subject was reported as the driver on any travel day trip by any household member (WHODROVE (G49) on any household member travel day trip has the subject's person number) then the subject is a driver (DRIVER (derived) = 1).
29. DRVRCNT: The number of drivers in the household. The variable is derived by counting the number of occurrences of DRV\_P1 through DRV\_P14 that are 1.
30. DRVR\_FLG: The variable is 1 if the subject drove on the travel day trip (WHODROVE (G49) has the subject's person number). This flag should only be set on trips where TRPTRANS (G34), HOWPUB1-5 (G35), or HOWFRP1-5 (G38) is 1 through 7 or 91.

31. DRVR\_P1 to DRVR\_P14\*: Indicates if the household member was a driver on the day of the household interview. Derived from DRVR (C8). The P1, P2 etc. correspond to the last two digits of the person ID. In 1995 this variable was named P1\_DRVR to P14\_DRVR.
32. DRV\_P1 to DRV\_P14: Derived from DRIVER (derived). For household members who did not complete a person interview, the value is derived from DRVR (C8).
33. DTNOWALK\*: The variable is obtained from DTWALK (L2c).
34. DWELTIME: The time spent at destination. The variable is calculated by subtracting the start time of the subsequent travel day trip (STRTHR, STRTMIN, STRTAMPM (G16)) from the end time of the current trip (ENDHOUR, ENDMIN, ENDAMPM (G17)).
35. EDITENTM: The end time (ENDHOUR, ENDMIN, ENDAMPM (G17)) for a travel day trip was edited.
36. EDITMILE: The trip distance (TRIPDIST, TRIPUNIT (G40)) for a travel day trip was edited.
37. EDITMIN: The time it took to make the travel day trip (TRVLHR, TRVLMIN (G42)) was edited. In 1995 this variable was named EDIT\_MIN.
38. EDITMODE: The main transportation mode (TRPTRANS (G34)) for the travel day trip was edited.
39. EDITPURP: The purpose (AWAYHOME (G25) or WHYTRP90 (G26)) for a travel day trip was edited.
40. EDITSTTM: The start time (STRTHR, STRTMIN, STRTAMPM (G16)) for a travel day trip was edited.
41. EIADMPG: Miles per gallon estimate for this vehicle derived by EIA.
42. EPATMPG: EPA estimate of total miles per gallon for this vehicle provided by EIA.
43. EPATMPGF: Indicates that EPATMPG was imputed. Variable provided by EIA.
44. ESTMILES: Mileage for vehicles owned less than 12 months. For vehicles where L8 is -7, -8 or -9, ESTMILES (L10) should be set to -9. In 1995 this variable was named VEHMILES.
45. ESTMLCAT\*: Mileage category for vehicles owned less than 12 months. Derived from ESTMILE2 (L10B).

46. EXPFLHHN: HH weight for 100 percent completed households for the national sample only provided on the Version 2 file in variable EXPFLHH.
47. EXPFLHH: Household weight for households where 100 percent of household members 18 and over completed a person interview.
48. EXPFLPR: Person weight for households where 100 percent of household members 18 and over completed a person interview.
49. EXPFLTD: Travel day trip weight for persons in households where 100 percent of household members 18 and over completed a person interview.
50. EXPFLPRN: Person weight for 100 percent households for the national sample only. Delivered as variable EXPFLPR in Version 2.
51. EXPFLTDN: Travel day trip weight for 100 percent households provided as variable EXPFLTD in Version 2.
52. EXPSCRHH: Household weight for households that have completed a household interview.
53. FINSAS: Travel day end time in SAS. The variable is derived from ENDFHOUR, ENDFMIN, ENDFAMP (G17).
54. FLGFINCM: Indicates that the income of all household members is included in HHFAMINC (derived). The variable is derived from NONFMFLG (M22). In 1995 this variable was named NONFMFLG.
55. FLGNXTDY: The variable indicates that the travel day trip started on the travel day but ended on the day following the travel day. Identify the trips based on their order in the trip roster and the time they started and ended.
56. FLGPRDRV: Indicates the number of vehicles in the household for which the subject is the primary driver. Used WHOMAIN (C12) to determine who is the primary driver of each household vehicle. Then, for each household member counted the number of vehicles where s(he) is the primary driver and coded into the appropriate categories.
57. FUELTYPE: Vehicle fuel type provided by EIA
58. GCDWORK: Great circle distance in miles between home and work. Calculated using the home address (D4/D5/D8/D9/M11/M12) and work address (E10/E11/E12/E13) provided by the household. A -9 indicates that no distance was calculated.

59. GSCOST: Fuel cost estimated in cents per gallon for this vehicle in the local area provided by EIA.
60. GSTOTCST: Total cost of fuel per year for this vehicle derived from variables GSCST and GSYRGAL. Provided by EIA.
61. GSYRGAL: Gallons of gasoline per year for this vehicle derived from variables BESTMILE and EIADMPG. Provided by EIA.
62. HBHRES DN: Housing units density in units per square mile provided by Claritas.
63. HBHTNRNT: Percent renter-occupied housing provided by Claritas.
64. HBHUR: Urban/rural code provided by Claritas.
65. HBPPOPDN: Population density provided by Claritas.
66. HHBG: Census Block Group for the household's home address. The source used was the GDT Dynamap 2000 (from Census 2000 TIGER/Line files).
67. HHCITY: This is the city where the subject resides. Use the city provided by geocoders based on responses provided to D4 or M11. If MAILHOME (D6) is 1, it is the city reported in MAILCITY (D4/D5). Else, it is the city reported in HMCITY (M11).
68. HHCITYFP: City FIPS Code for the household's home address. The source used was the 2000 Incorporated Places/ Census Designated Place FIP Code, Geographic Data Technology (GDT) Dynamap/2000. A -999 indicates that we were unable to identify a FIPS code.
69. HHCNTY\*: The variable is obtained from COUNTYNY (D10).
70. HHCNTYFP: County FIPS Code for the geocode for the household's home address. The source used was the United States Census Bureau State and County: 2000 County and County Equivalent Areas: Cartographic Boundary Files. File co99\_d00.shp from [HTTP://WWW.CENSUS.GOV/GEO/WWW/COB/CO2000.HTM](http://www.census.gov/geo/www/cob/co2000.htm)
71. HHCT: This is the Census Tract for the geocode for the household's home address. The source used was the GDT Dynamap 2000 (from Census 2000 TIGER/Line files).
72. HHC\_MSA: The CMSA or MSA code for the household's home address. In 1995 this variable was named HHMSA.

73. HHFAMINC: Total household family income for the last 12 months derived from HHFAMINC (M13) and HHINC (M14-M21). If HHINC is missing, randomly pick either the lower or upper range from HHFAMINC (M13). The income in this variable will be less than the income in HHINCTTL if at least one household member's income was not reported in M13.
74. HHINCTTL: This is the derived total income for the household and includes the income for individual household members even if they were reported individually. It is the sum of HHFAMINC (derived) and INCM\_P1 through INCM\_P14 (derived). Obtain the sum by adding the mid-point of the ranges for these derived variables.
75. HHINTDOW: The day of week the household interview was completed.
76. HHINTDT: The month and year the household interview was completed (YYYYMM).
77. HHINTDT2: The day, month and year the household interview was completed (YYYYMMDD).
78. HHMNINC: Number of household members with income NOT included in HHFAMINC. Count the number of person numbers in HHMINC1-15 (M23).
79. HHRESP: The unique 2-digit person ID number for the household respondent. This is the last two digits of the person ID number.
80. HHR\_AGE\*: Age of the household respondent. Derived from AGE (C5).
81. HHR\_DRVR: Indicates whether the household respondent is a driver. Derived from DRVR (C8). In 1995 this variable was named REF\_DRVR.
82. HHR\_EDUC: Indicates the education level of the household respondent. Derived from EDUC (M7).
83. HHR\_HISP\*: Indicates the Hispanic ethnicity for the household respondent. Derived from HH\_HISP (C6).
84. HHR\_RACE: The race of the household respondent for the household. Code the variable as follows:
  - 01 Variable HH\_RACE1 (C7) is yes (White) and no other variable is yes.
  - 02 Variable HH\_RACE2 (C7) is yes (African American, Black) and no other variable is yes.
  - 03 Variable HH\_RACE3 (C7) is yes (Asian) and no other variable is yes.
  - 04 Variable HH\_RACE4 (C7) is yes (American Indian, Alaskan Native) and no other variable is yes.

- 05 Variable HH\_RACE5 (C7) is yes (Native Hawaiian, Other Pacific Islander) and no other variable is yes.
  - 06 Variable HH\_RACE7 (C7) is yes (Hispanic/Mexican) and no other variable is yes.
  - 07 Variables HH\_RACE1 and HH\_RACE2 (C7) are yes (White and African American, Black) and no other variables are yes.
  - 08 Variables HH\_RACE1 and HH\_RACE3 (C7) are yes (White and Asian) and no other variables are yes.
  - 09 Variables HH-RACE1 and HH\_RACE4 (C7) are yes (White and American Indian, Alaskan Native) and no other variables are yes.
  - 10 Variables HH\_RACE1 and HH\_RACE7 (C7) are yes (White and Hispanic/Mexican) and no other variables are yes.
  - 11 Variables HH\_RACE2 and HH\_RACE7 (C7) are yes (African American, Black and Hispanic/Mexican) and no other variables are yes.
  - 12 Variables HH\_RACE4 and HH\_RACE7 (C7) are yes (American Indian, Alaskan Native and Hispanic/Mexican) and no other variables are yes.
  - 13 Only two race variables in HH\_RACE1 through HH\_RACE8 (C7) are yes and they are not categories 07 through 12 above.
  - 14 Three race variables in HH\_RACE1 through HH\_RACE8 (C7) are yes.
  - 15 Four race variables in HH\_RACE1 through HH\_RACE8 (C7) are yes.
  - 16 Variable HH\_RACE6 (C7) is yes or the combination of races provided in HH\_RACE1 through HH\_RACE7 do not match categories 07 through 14.
  - 17 Variable HH\_RACE8 (C7) is yes and none of the categories above apply.
85. HHR\_SEX\*: Indicates the gender of the household respondent. Derived from SEX (C5).
86. HHR\_STAT: Final Person Interview Status Code for the household respondent. The household respondent in the household is the household member with a code of 1 for variable HH\_RELAT (C8). Store the final person interview result code for this household member in the field. In 1995 this variable was named REF\_STAT.
87. HHR\_WRKR: Indicates if the household respondent is a worker. It is derived from WORKER (derived) and HHRESP (derived). In 1995 this variable was named REF\_WKR.
88. HHSIZE: Count of household members in the household. Use the number enumerated in C8, excluding persons with a final result code beginning with "O."
89. HHSTATE: This is the geocoded state for the household's home address.
90. HHSTFIPS: State FIPS code for the geocode for the household's home address. The source used was the United States Census Bureau State and County: 2000 County and County Equivalent Areas: Cartographic Boundary Files. File co99\_d00.shp from [HTTP://WWW.CENSUS.GOV/GEO/WWW/COB/CO2000.HTM](http://www.census.gov/geo/www/cob/co2000.htm).

91. HHTOTD: Number of days between the date the household completed the household interview and the date of the travel day.
92. HHVEHCNT: The number of vehicles in the household on the date of the household interview. This is the number of vehicles enumerated in B2 and verified in L7 and during the odometer collection process. Note, a vehicle that is determined to be sold either during the person interview or odometer collection process is still counted as a household vehicle on the date of the household interview. Vehicles used on the travel day or travel period are also counted as household vehicles.
93. HHZIP: This is the ZIP code for the place where the subject resides. If MAILHOME (D6) is 1, it is the ZIP (D9) reported in MAILZIP (D4/D5). Else, it is the ZIP reported in ZIP (D9) or HMZIP (M11). However, the geocoded ZIP if present should be used instead of either the ZIP in D4, D9 or M11.
94. HH\_ONTD: Total number of household members on this travel day trip including subject. Derived from the sum of ONTD\_P1 through ONTD\_P14 (derived). In 1995 this variable was named NUMONTRP.
95. HOMEGEO: Indicates the geocoding level to which the home address was geocoded. Code the variable as follows:
  - 1 An exact street address was used to geocode the address.
  - 2 The nearest intersection was used to geocode the address.
  - 4 The Zip code centroid was used to geocode the address.
96. HOMELAT: The latitude for the home address.
97. HOMELONG: The longitude for the home address.
98. HOUSEID\*: The nine-digit household ID number.
99. HTEEMPDN: Jobs per square mile at the tract level provided by Claritas.
100. HTHRESDN: Housing units per square mile at the tract level provided by Claritas.
101. HTHNRNT: Percent renter-occupied housing at the tract level provided by Claritas.
102. HTHUR: Census tract urban/rural code provided by Claritas.
103. HTPPOPDN: Population density (persons per square mile) at the tract level provided by Claritas.

104. IMPTAGE: Subject's age (AGE (C8)) was imputed.
105. IMPTENTM: The end time (ENDHOUR, ENDMIN, ENDAMPM (G17)) for a travel day trip was imputed.
106. IMPTHOWN: Whether the home was owned or rented (HOMEOWN (C2)) was imputed.
107. IMPHTHTYP: The type of home (HOMETYPE (C1)) the household lives in was imputed.
108. IMPTMILE: The trip distance (TRIPDIST, TRIPUNIT (G40)) for a travel day trip was imputed.
109. IMPTMIN: The travel time (TRVLHR, TRVLMIN (G42)) for a travel day trip was imputed.
110. IMPTPHON: The values of OTHRPHON (C15) and NONVOICE (C16) were modified to agree with each other.
111. IMPTRACE: The race (HH\_RACE1 through HH\_RACE8 (C7)) for the household respondent was imputed.
112. IMPTSEX: The subject's gender (SEX (C8)) was imputed.
113. IMPTSTTM: The start time (STRTHR, STRTMIN, STRTAMPM (G16)) for a travel day trip was imputed.
114. IMPTTTPUB: Presence of public transportation on this travel day trip has been imputed. Code the value of the variable as 1 (yes) if TRPTRANS (G34), HOWPUB1-5 (G35), or HOWFRP1-5 (G38) is code 10, 11, 16, 17 or 18. Else, code it as 2 (no).
115. IMPTTTRIP: An entire travel day trip (Section G trip) was imputed.
116. INCM\_P1 through INCM\_P14: Person income derived from NONFMINC (M24) and PERINC (M25 through M32). If PERINC is missing, randomly pick either the lower or upper range from NONFMINC.
117. INC\_P1 through INC\_P14\*: Indicates whether the subject's income is not included in HHFAMINC (derived). Derived from HHMINC1 through HHMINC15 (M23).
118. INDVINC: Income of this household member, if reported separately. Derived from NONFMINC (M24) and PERINC (M25 through M32). If PERINC is missing,

randomly pick either the lower or upper range from NONFMINC. In 1995 this variable was named NONFMINC.

119. LANG: Language the household interview was conducted in. Derived from variable SCRN.ENGLSPAN.

120. LIF\_CYC: The life cycle code for the household. The variable is derived as follows:

- 01 Household has one adult, no children and no retired persons.
- 02 Household has 2 or more adults, no children and no retired persons.
- 03 Household has one adult and the youngest child is 0 to 5 years old.
- 04 Household has 2 or more adults and the youngest child is 0 to 5 years old.
- 05 Household has one adult and the youngest child is 6 to 15 years old.
- 06 Household has 2 or more adults and the youngest child is 6 to 15 years old.
- 07 Household has one adult and the youngest child is 16 to 21 years old.
- 08 Household has 2 or more adults and the youngest child is 16 to 21 years old.
- 09 Household has one retired adult and no children.
- 10 Household has 2 or more adults, at least one is retired and no children.

Classify each household member as adult or child and determine retirement status for adults. Then, use the adult, child and retired classification of each household member to classify the household into one of the 10 categories above.

An adult is defined as a household member that is 18 and over. A child is a household member 21 years or younger. A household member between the ages of 18 and 21 is classified as an adult or child depending on his/her relationship to the household respondent. If age is missing, use the imputed age. A household member is retired if PRMACT=6 and is not retired if PRMACT > 0, but PRMACT is not equal to 6.

If retirement status is missing, use age to determine retirement status. If age is 65 or more, consider the person retired. If less than 65, consider the person not retired. Assign these households to Life Cycle categories 1, 2, 9 or 10.

Use the following rules to determine whether the household member is an adult or child:

1. If household member's age is less than 18 years, classify a household member as a CHILD regardless of value of REL\_Pn (C8) and classify household member's CHILD AGE in the appropriate group 0-5, 6-15, or 16-21.
2. If household member's age is greater than 21 years, classify a household member as an ADULT regardless of value of REL\_Pn.
3. If household member's age is 18-21 and REL\_Pn= 3 (CHILD), classify household member as CHILD and classify household member's CHILD AGE in

- 16-21 group.
4. If household member's age is 18-21 and household member is the household respondent (REL\_Pn=1) and any other household member is coded as PARENT to the household respondent (REL\_Pn=4), classify subject household member as CHILD and classify subject's CHILD AGE in 16-21 group. If no other household member is PARENT, classify subject household member as ADULT.
  5. If household member is BROTHER/SISTER to the household respondent (REL\_Pn=5) and any other household member is coded as PARENT to the household respondent (REL\_Pn=4), classify subject household member as CHILD and classify subject's CHILD AGE in 16-21 group. If no other household member is PARENT, classify subject household member as ADULT.
  6. If household member's age is 18-21 and household member is OTHER RELATIVE (REL\_Pn=6) and any other household member is coded as PARENT to the household respondent (REL\_Pn=4), classify subject household member as CHILD and classify subject's CHILD AGE in 16-21 group. If no other household member is PARENT, classify subject household member as ADULT.
  7. If household member's age is 18-21 and household member is a NON-RELATIVE (REL\_Pn=8) to the household respondent, and any other household member is over 21 and is a SPOUSE (REL\_Pn= 2) or any other household member is over 21 and is an UNMARRIED PARTNER (REL\_Pn= 7), then classify the household member as a CHILD in the 16-21 age group; otherwise classify the household member as an ADULT.
  8. If household member's HH\_RELAT is missing: If age is <18, classify adult status of household member as CHILD and classify CHILD AGE according to age. If age is >21 classify adult status as ADULT. If age is 18-21, and any other household member is coded as PARENT, then classify subject household member as CHILD and CHILD AGE in 16-21 age group. If no other household member is classified as PARENT classify adult status of subject household member as UNKNOWN.
  9. Households with HH\_RELAT=2 (SPOUSE) or 7 (UNMARRIED PARTNER) between the ages of 18 and 21 that are not classified should be classified as ADULTS.
121. LSTTRDAY: Number of days since last trip before travel day. Derived from LSTTRDT2 (derived), LASTRPNU and LASTRPUT (G15) and TDAYDAT2 (derived). Use information from LSTTRDT2 and G15 to determine when the subject last took a trip and then calculate the difference between this date and the assigned travel day.
122. LSTTRDT: Month and year of last trip before travel day. Derived from LASTRPMM, LASTRPYY (G14). Not reported if month or year is missing (YYYYMM).

123. LSTTRDT2: Date of last trip before travel day. Derived from LASTRPDD, LASTRPMM, LASTRPYY (G14). Not reported if day, month or year is missing (YYYYMMDD).
124. LSTTRUNT\*: Units reported for time since last trip before travel day. Derived from LASTRPUT (G15).
125. MAILHOME: Pre-household interview letter was mailed to the household and not returned.
126. MAKECODE: NASS vehicle make code. Derived from MAKECODE (B2), E\_MAKE (L7), and odometer readings.
127. MAKENAME: NASS description of vehicle make in vehicle file obtained from NHTSA. Derived from VEHIMAKE (B2), E\_VMAKE (L7), and odometer readings.
128. MILELIMIT: Indicates that ANNMILES (derived) was capped at 200,000.
129. MODLCODE: NASS vehicle model code. Derived from MODLCODE (B2), E\_MODL (L7), and odometer readings.
130. MODLNAME: NASS description of vehicle model in vehicle file obtained from NHTSA. Derived from VEHIMODL (B2), E\_VMODL (L7), and odometer readings.
131. MSACAT: MSA category for the geocode for the household's home address. The source used for MSA's was the 1999 Metropolitan Areas: Cartographic Boundary Files. File ma99\_99.shp from [HTTP://WWW.CENSUS.GOV/GEO/WWW/COB/MA1999.HTML](http://www.census.gov/geo/www/cob/ma1999.html). The MSACAT variable was derived using information on population and the presence of transit. The variable is derived as follows:
- 1 MSA or CMSA of 1 million or more with rail.
  - 2 MSA or CMSA of 1 million or more and not in category 1.
  - 3 MSA of less than 1 million.
  - 4 Not in a MSA.
132. MSASIZE: Population size category of the MSA for the household's home address. The source used was the Total Population by MSA from Census 2000 STF1. The variable is derived as follows:
- 1 MSA of less than 250,000.
  - 2 MSA of 250,000 to 499,999.
  - 3 MSA of 500,000 to 999,999.
  - 4 MSA or CMSA of 1,000,000 to 2,999,999.
  - 5 MSA or CMSA of 3 million or more.
  - 6 Not in a MSA.

133. NBIKETRP\*: The variable was obtained from BIKETRIP (L4)
134. NONHHCNT: Number of non household members on travel day trip. Derived from NONHHACC (G46) and NONHHCNT (G47). If G46 = 2, then put in a 0 for count.
135. NUMADLT: Count of adults, household members 18 and older in household. Derived by using the age reported in AGE (C8) and AGERANGE (C10). If both C8 and C10 are missing, use the imputed age.
136. NUMONTRP: Total count of people on travel day trip, including subject. Derived by adding HH\_ONTD (derived) and NONHHCNT(derived).
137. OCCAT\*: Subject's occupation. Derived from JOBCATEG (E7).
138. OD\_READ1: The first odometer reading. This is derived from the reading collected during the person interview (OD\_READ (N3)) or through a subsequent call to the household.
139. OD\_READ2: The second odometer reading. This is derived from readings obtained through the US mail, faxes, Internet, incoming telephone calls from the household, or outgoing telephone calls to the household.
140. ONTD\_P1 through ONTD\_P14: Household member was on the travel day trip. Derived by assuming the subject was on the trip and adding anyone else reported in WHOACC1 through WHOACCN (G45).
141. OUTOFTWN\*: Indicates whether the subject was out of town for the entire travel day. Derived from OUTOFTWN (G9). Display the variable for on each travel day trip.
142. PERINDOW: The day of week that corresponds to the date the person interview was completed.
143. PERINDT2: The date the person interview was completed (YYYYMMDD).
144. PERSONID: A unique two-digit number for each household member often appended to the household ID number. Derived from the last two digits of the person's identification number.
145. PRCASEID\*: The 11 digit person ID derived from ENUMID.
146. PRMDRVR1: Household vehicle that subject is primary driver of, derived from WHOMAIN (C12) and B2 (VEHID).

147. PRMDRVR2: A second household vehicle that subject is primary driver of, derived from WHOMAIN (C12) and B2 (VEHID)
148. PRMDRVR3: A third household vehicle that subject is primary driver of, derived from WHOMAIN (C12) and B2 (VEHID).
149. PROXCAT: Breakdown of proxy interviews by age of the subject. The variable is derived using AGE (C8), AGERANGE (C10) and the final completion result code for the subject. If age is missing, use imputed age.
- 1 Proxy for subject who is 13 years or younger.
  - 2 Proxy for subject who is 14 or 15 years old.
  - 3 Proxy for subject who is 16 or 17 years old.
  - 4 Proxy for subject who is 18 years or older.
  - 5 No proxy, interview completed by subject
150. PSGR\_FLG: Subject was passenger on travel day trip that involved only POV modes. Derived from ONTD\_P1 (derived) and DRVR\_FLG (G49). Add the variable only to POV trips where person was not a driver, but was on the trip. POV trips are those where TRPTRANS (G34) has a value of 1 through 7.
151. RAIL: Indicates whether the household is located in a MSA with rail. Derived from MSACAT (derived). If MSACAT is 1, RAIL is 1 (MSA has rail). Else, RAIL is 2.
152. RATIO16V: Ratio of household members 16+ to number of household vehicles. Derived from AGE (C8) and HHVEHCNT (derived). If age is missing use the imputed age.
153. RATIO16W. Ratio of household members 16+ to number of workers in the household. Derived from AGE (C8) and WRKCOUNT (derived). If age is missing use the imputed age.
154. RATIOVV: Ratio of number of workers to the number of vehicles in the household. Derived by dividing WRKCOUNT (derived) by HHVEHCNT (derived).
155. READATE1: Date of the 1<sup>st</sup> odometer reading. Derived from OD\_MONTH, OD\_YEAR (N3) obtained during the person interview and subsequent calls to the household. Deliver in YYYYMM format.
156. READATE2: Date of the 2<sup>nd</sup> odometer reading. This is derived from reading dates obtained through the US mail, faxes, Internet, incoming telephone calls from the household, or outgoing telephone calls to the household. Deliver in YYYYMM format.
157. READAT1: Date of the 1<sup>st</sup> odometer reading. Derived from OD\_MONTH, OD\_YEAR, OD\_DAY (N3) obtained during the person interview and subsequent

calls to the household. Deliver in YYYYMMDD format.

158. READAT2: Date of the 2<sup>nd</sup> odometer reading. This is derived from reading dates obtained through the US mail, faxes, Internet, incoming telephone calls from the household, or outgoing telephone calls to the household. Deliver in YYYYMMDD format.
159. REL\_P1 to REL\_P14\*: The household member's relationship to the household respondent. Derived from HH\_RELAT (C8). In 1995 this variable was named P1\_REL to P14\_REL.
160. RESP\_CNT: Count of total responding persons in the household, all ages. A responding person is one who completed a person-level interview (either by self or proxy). Derived by counting the number of persons with a final result code beginning with a "C."
161. R\_AGE\*: Age of subject. Derived from AGE (C8). Do not put in the imputed age. Leave values as -7, -8 and -9.
162. R\_AGEWGT: Age of subject used in weighting. Replace values in R\_AGE that are -7, -8 or -9 with the imputed age values.
163. R\_RELAT\*: Relationship of subject to household respondent. Derived from HH\_RELAT (C8).
164. R\_SEX\*: Gender of subject. Derived from SEX (C8).
165. SEX\_P1 to SEX\_P14\*: The gender of the subject. Derived from SEX (C8). In 1995 this variable was named P1\_SEX to P14\_SEX.
166. SMPLAREA: Indicates the add-on area where the household resides. Cases in the national sample that cannot be allocated to one of the 9 add-on areas should be put in category 10.  
Code 01=Baltimore Area (derive from variables SITEID and SAMPL).  
Code 02=Des Moines (derive from variables SITEID and SAMPL).  
Code 03=Hawaii (derive from variables SITEID and SAMPL).  
Code 04=Kentucky (derive from variables SITEID and SAMPL).  
Code 05=Lancaster (derive from variables SITEID and SAMPL).  
Code 06=New York (derive from variables SITEID and SAMPL).  
Code 07=Oahu (derive from variables SITEID and SAMPL).  
Code 08=Texas (derive from variables SITEID and SAMPL).  
Code 09=Wisconsin(derive from variables SITEID and SAMPL).  
Code 10=Cases where SAMPSRCE is main and not in categories 1 through 9.
167. SMPLFIRM: Holds the name of the firm that collected the data. Code 1 for Westat

if SAMPSRCE is Main or Add-on. Else, code 2 for Morpace.

168. SMPLSRCE: Indicates if the case was in the main national sample or an add-on sample. Code as follows:

Code 01=National sample if SAMPSRCE is main.

Code 02=Baltimore Add-on (use SITEID).

Code 03=Des Moines Add-on (use SITEID).

Code 04=Hawaii Add-on (use SITEID).

Code 05=Kentucky Add-on (use SITEID).

Code 06=Lancaster Add-on (use SITEID).

Code 07=New York Add-on (use SITEID)..

Code 08=Oahu Add-on (use SITEID).

Code 09=Texas Add-on (use SITEID).

Code 10=Wisconsin Add-on (use SITEID).

169. STAT\_P1 to STAT\_P14: The final response status for each household member. In 1995 this variable was named P1\_STAT to P14\_STAT. The variable is derived as follows:

1 Interview completed by subject. Includes result code CS.

2 Interview completed by proxy. Includes result code CP.

3 Language or communication barrier. Includes result codes LH, LM, LP.

4 Subject refused. Includes result codes R3, RB, RM, RX.

5 Maximum Calls made. Includes result codes MC, ML, MR, MT.

6 Interview not Possible: Subject deceased.

7 Other non-interview. Includes result codes NF, NO, NS.

8 Unable to contact. Includes result codes NR and NW.

170. STRTSAS: Travel day trip start time in SAS. Derived from STRTHR, STRTMIN, STRTAMPM (G16).

171. STRTTIME: The start time of a travel day trip (STRTHR, STRTMIN, STRTAMPM (G16)) reported in military time (0001 through 2400 hours).

172. SUM\_STAT: The variable indicates the households where all adult persons have completed a person interview. If all household members have a result code that begins with C, code as 1. Else, code as 2.

173. TDAYDAT2: The day, month and year for the household's assigned travel day (YYYYMMDD).

174. TDAYDATE: The month and year for the household's assigned travel day (YYYYMM). In 1995 this variable was named TDAY\_MON, TDAY\_YR.

175. TDBOA911: Indicates whether the travel day was before or on or after September

- 11, 2001. Derived from variable TDAYDAT2. The variable is 1 if the travel day was before 9/11/01 and 2 if it was on or after 9/11/01.
176. TDCASEID: The 13 digit travel day trip ID derived from PRCASEID (derived) and DTRPNUM.
177. TDMSDTRP: Indicates missed travel day trips.
- The variable is 1 if the missed trip was reported by the subject after all other travel day trips were rostered. Derived from DP\_FLAG.
  - The variable is 2 if the missed trip was not reported by the subject but reported by a subsequent household member who indicated the subject was on the trip too.
178. TDTRPNUM: The travel day trip number for the subject. This is derived from the last two digits of the trip identification number.
179. TDWKND: Variable indicates if the travel day trip fell on a weekend. Derived from TRAVDAY (derived) and STRTTIME (derived). Weekend is defined as all trips starting between 1800 hours on Friday and 2400/0000 hours on Sunday.
180. TELBFM\*: The number of additional non-cellular household telephone numbers used exclusively for business, fax, or as computer modems. Does not include the household phone that was sampled. Derived from NONVOICE (C16).
181. TELCELL\*: The number of cellular phones used by household members. Derived from HHNUMCEL (C14).
182. TELLAND: Total number of landline phones. Derived from OTHRPHON (C15) + 1.
183. TELTOTL: Total number of land lines and cellular phones including those used exclusively for business, fax, or as modem. Derived by adding TELLAND (derived) and TELCELL (derived).
184. TELTYPE: Indicates whether the sampled telephone number is used for home use only or for both home and business use. Derived from SFONEUSE (A1).
185. TPOVRLAP: Code 1 if this travel day trip overlaps with an entire or portion of a trip reported during the enumeration of travel period trips.
186. TRACC1 through TRACC5\*: The transportation mode (access) used to get to public transportation. Derived from HOWPUB1-5 (G35).
187. TRACCTM: Time taken to get to public transportation on travel day trip, converted to minutes. Derived by converting LONGTO, LONGMIN (G36) to minutes.

188. TRAVDAY: The day of week for the household's assigned travel day.
189. TREGR1 through TREGR5\*: The transportation mode (egress) used to get from public transportation to the final destination. Derived from HOWFRP1-5 (G38).
190. TREGRTM: Time taken to get from public transportation, converted to minutes. Derived from LONGFR and LONFMIN (G39).
191. TRPBLKS: Travel day trip distance if reported in blocks by the respondent. Derived from TRIPDIST and TRIPUNIT (G40). If TRIPUNIT is 1, then code the value in TRIPDIST in TRPBLKS.
192. TRPDIST\*: Travel day trip distance reported in miles or blocks. Code the value in TRIPDIST (G40).
193. TRPMILES: Travel day trip distance in miles, whether originally reported in miles or blocks. Derived from TRIPDIST and TRIPUNIT (G40). If TRIPUNIT is in blocks, convert 9 blocks to 1 mile.
194. TRVL\_MIN: Time to complete entire travel day trip in minutes. Derived from TRVLHR and TRVLMIN (G42).
195. TRWAITTM: Time spent waiting for public transportation on travel day trip in minutes. Derived from WAITMINU and WAIT\_MIN (G37).
196. URBAN: The household's home address is in an urbanized area. The source used is Urban Areas: 2000 Urbanized Areas: Cartographic Boundary Files. File ua00\_d00.shp from [HTTP://WWW.CENSUS.GOV/GEO/WWW/COB/UA2000.HTML](http://www.census.gov/geo/www/ua2000.html). The categories are:
- 1 = Urban Area, in Urban Cluster
  - 2 = Urban Area
  - 3 = Urban Area, surrounded by Urban Areas
  - 4 = Not in an Urban Area
197. URBRUR: The household's home address is in an urban or rural area. Derived from URBAN. If URBAN is 1, 2 or 3, code as 1 (Urban). Else, code as 2 (Rural).
198. VEH12MNT: The variable indicates whether the vehicle was received in the last 12 months. If VEHOWNMO is 12 months or less, code 1 for yes. Else, code 2.
199. VEHID: The household vehicle number derived from the last two digits of the 11 digit vehicle ID in CATI.
200. VEHMLCAT\*: The variable was obtained from VEHMILE2 (L9b).

201. VEHOWNMO: How long the vehicle has been owned, converted to months. Derived from VEHOWNED and OWNUNIT (L8).
202. VEHTYPE\*: This is derived from variable E\_VTYPE (L7).
203. VEHUSED\*: The variable was obtained from VEHID (G31).
204. VEHYEAR: Vehicle year, derived from VEHYEAR (B2), E\_VYEAR (L7) and odometer readings.
205. VHCASEID\*: The 11 digit vehicle identification number derived from VEHIID in CATI.
206. VTYPFUEL: This variable is derived from VEHTYPE and FUELTYPE. The variable is provided by ORNL.
207. WEBWHER: Location from where the Internet is used. Derived from variables WEBACC (M1), WEBHOME (M3), WEBWORK (M3) and WEBOTHER (M3).
208. WHERBORN: Region of birth, derived from BORNWHER.
- |    |  |
|----|--|
| 1  | US-Territories.                              |

| 13 | Caribbean/Atlantic Islands.                  |
209. WHERESP\*: Description of travel day trip destination. Derived from WHERE and WHEREOS (G12).
210. WHYFROM: Travel day trip purpose for the previous trip. Derived from AWAYHOME (G25) or WHYTRP90 (G26) for previous trip. Note the addition of code 24 (daycare), which is not on the questionnaire.
211. WHYTO: Travel day trip purpose for the current trip. Derived from AWAYHOME (G25) or WHYTRP90 (G26) for current trip. Note the addition of code 24

(daycare), which is not on the questionnaire.

212. WHYTRP01: Detailed travel day trip purpose. Derived from AWAYHOME (G25) and WHYTRP90 (G26).

213. WHYTRP1S: Travel day trip purpose summary. The variable is derived as follows:

- 1 To work. If G25/G26 is 11.
- 2 Work related. If G25/G26 is 13 or 14.
- 3 School. If G25/G26 is 21 or 23.
- 4 Religious. If G25/G26 is 22
- 5 Medical/dental. If G25/G26 is 30.
- 6 Shopping. If G25/G26 is 41 or 43
- 7 Other family and personal. If G25/G26 is 24, 40, 42 or begins with a 6.
- 8 Social and recreational. If G25/G26 begins with a 5
- 9 Eat meal. If G25/G26 begins with an 8
- 10 Serve passenger. If G25/G26 begins with a 7.
- 11 Return to work. If G25/G26 is 12.
- 12 Return home. If G25/26 is 1 or 17.
- 13 Trip purpose does not fall in categories 1 through 12.

214. WHYTRP90: Travel day trip purpose codes as defined in the 1990 NPTS.

215. WKCITYA: Name of the city where the subject's work place is located. Derived from the geocoded address. The source used was the 2000 Incorporated Places/ Census Designated Place, Geographic Data Technology (GDT) Dynamap/2000. A NIP indicates "not in place," NA indicates "unable to identify a city name".

216. WKCNFIPS: County FIPS Code for the geocode for the subject's work address. The source used was the United States Census Bureau State and County: 2000 County and County Equivalent Areas: Cartographic Boundary Files. A 99 indicates that we were unable to code to the county level.

217. WKCNTYA: Name of the county where the subject's work place is located. Derived from the geocoded address. The source used was the United States Census Bureau State and County: 2000 County and County Equivalent Areas: Cartographic Boundary Files. A NA indicates that we were unable to identify a county name.

218. WKCTFIPS: City FIPS Code for the geocode for the subject's work address.

219. WKR\_P1 to WKR\_P14: Derived from WORKER (derived). For household members who did not complete a person interview the value is the response provided in WRKR (C8). In 1995 this variable was named P1\_WKR to P14\_WKR.

220. WKSTFIPS: State FIPS Code for the geocode for the subject's work address. The source used was the United States Census Bureau State and County: 2000 County and County Equivalent Areas: Cartographic Boundary Files. File co99\_d00.shp from <http://www.census.gov/gEO/www/COB/CO2000.HTM>. A -9 indicates that we were unable to geocode the state where the workplace is located.
221. WORKCT: Census Tract for the geocode for the subject's work address. The source used was the GDT Dynamap 2000 (from Census 2000 TIGER/Line files). A 9999 indicates that we were unable to identify a Census Tract.
222. WORKER: Indicates whether the subject is a worker. The subject is a worker if WRKR (C8) = 1, PRMACT (E3) = 1 or 2, or PAYPROF (E4) = 1.
223. WORKGEO: A description of the information used to geocode the work address. Code the variable as follows:
- 1 An exact street address was used to geocode the address.
  - 2 The nearest intersection was used to geocode the address.
  - 3 A landmark was used to code the address.
  - 4 The address was geocoded to the ZIP code centroid.
  - 5 Information on the employer was used to geocode the address.
  - 6 The address was geocoded to the city/county centroid or the county equivalent area.
  - 7 The address was geocoded to the state centroid.
  - 8 The address was not geocoded or was international.
224. WORKLAT: The latitude for the work address.
225. WORKLOC: The variable indicates whether the subject worked from home, a fixed work place or had some other work arrangement. The variable is derived as follows:
- 1 Works only at a workplace. If E10 (WKSTNAME, WKCITY, WKSTATE, WKZIP) has a street address, city, state or ZIP and WKFMHM2M (E19) is 2.
  - 2 Works only at home. If E10 (WKSTNUM) is "home."
  - 3 No fixed workplace. If E10 (WKSTNUM) is "none."
  - 4 Home and work. If E10 (WKSTNAME, WKCITY, WKSTATE, WKZIP) has a street address, city, state or ZIP and WKFMHM2M (E19) is 1.
226. WORKLONG: The longitude for the work address.
227. WORKSTAT: State in which subject's workplace is located. Derived from the geocoded workplace address.
228. WORKZIP: Zip Code for the jurisdiction in which the subject's workplace is located.

Derived from the geocoded workplace address.

229. WRKCOUNT: The number of household members that are workers. Derived by summing all occurrences where WKR\_P1 through WKR\_P14 is 1.
230. WRKR\_P1 to WRKR\_P14\*: Indicates whether the subject had a job at the time of the household interview. Derived from WRKR (C8).
231. WTHHFIN: Household weight for households where at least 50 percent of household members 18 and over completed a person interview.
232. WTHHNTL: The household weight for 50 percent households provided in the Version 2 delivery in variable WTHHFIN.
233. WTPERFIN: Person weight for households where at least 50 percent of household members 18 and over completed a person interview.
234. WTPRNTL: The person weight for 50 percent households provided in the Version 2 delivery in variable WTPERFIN.
235. WTTRDFIN: Travel day trip weight for persons in households where at least 50 percent of household members 18 and over completed a person interview.
236. WTTRDNTL: Travel day trip weight for 50 percent households provided in variable WTTRDFIN in Version 2.
237. YRMLCAP: Flag indicates that the variable YEARMILE (L5) was capped at 200,000 miles. In 1995 this variable was named YMILEFLG.
238. YRMLCAT\*: The variable was obtained from YEARMIL2 (L5b).
239. YRTOUS\*: Year the subject entered the United States. Derived from variable WHENTOUS (M10).

## APPENDIX E

### ABBREVIATIONS, TRAVEL CONCEPTS AND GLOSSARY OF TERMS

#### ABBREVIATIONS

ASCII	American Standard Code for Information Interchange
ATS	American Travel Survey
BTS	Bureau of Transportation Statistics
CASRO	Council of American Survey Research Organizations
CATI	Computer Assisted Telephone Interviewing
CMSA	Consolidated Metropolitan Statistical Area
DOT	Department of Transportation
FHWA	Federal Highway Administration
FIPS	Federal Information Processing Standards
HH	Household
ID	Identification Number
HHM	Household Member
MPO	Metropolitan Planning Organization
MSA	Metropolitan Statistical Area
NHTS	National Household Travel Survey
NHTSA	National Highway Traffic Safety Administration
NPTS	National Personal Transportation Survey
NTS	National Travel Survey
PMSA	Primary Metropolitan Statistical Area
PMT	Person Miles of Travel
POV	Privately Owned Vehicle
PSU	Probability Sampling Unit
RDD	Random Digit Dialing
SAS	Statistical Analysis System
TRC	Telephone Research Center
VMT	Vehicle miles of Travel

#### TRAVEL CONCEPTS

**PERSON TRIP**      **DEFINITION** - A trip by one person in any mode of transportation. This is the most basic and universal measure of personal travel. Each record in the Travel Day and Travel Period files in the NHTS dataset represents one person trip.

**EXAMPLES** - Two household members travelling together in one

car are counted as two person trips. Three household members walking to the store together are counted as three person trips.

**WHEN TO USE** -The unit of person trips must be used when comparing travel by various modes (e.g., private vehicles, public transportation, walking, school bus, air, etc.). It is the appropriate unit of measure for the movement of people, as opposed to vehicles, e.g., "the High Occupancy Vehicle (HOV) lanes carry 42 percent of all person trips to the central city."

**HOW TO COMPUTE** - Because the person trip is the basic unit of measure on the Travel Day files, to obtain total person trips for useable households, the user should sum the weighted travel day records, i.e. sum WTTRDFIN.

**PERSON  
MILES OF  
TRAVEL (PMT)**

**DEFINITION** - The number of miles traveled by each person on a trip.

**EXAMPLES** - If two people travelling together take a six-mile subway trip to the airport, that trip results in 12 person miles of travel. A four-mile van trip with a driver and three passengers counts as 16 person miles of travel (4 people times 4 miles).

**WHEN TO USE** - As with person trips, person miles must be used when analyzing travel by the various modes of transport. It is the appropriate measure when the topic of analysis is the miles traveled by people, not vehicles.

**ALIAS** - Person miles is often called Passenger Miles, particularly in the transit and airline industries.

**HOW TO COMPUTE**- Multiply each weighted person trip (WTTRDFIN) by the travel day trip distance in miles (TRPMILES).

**WARNING** - When computing TRPMILES, be sure to exclude entries of:

- 1 question not applicable,
- 7 miles refused,
- 8 miles not known, and
- 9 miles not ascertained.

**VEHICLE TRIPS**

**DEFINITION** - A trip by a single privately operated vehicle (POV)

regardless of the number of persons in the vehicle.

**EXAMPLES** - Two people travelling together in a car would be counted as one vehicle trip. Four people going to a restaurant in a van is considered one vehicle trip.

**NPTS MODE RESTRICTIONS** - To be considered a vehicle trip in NHTS, the trip must have been made in a privately operated vehicle, namely a household-based car, van, sport utility vehicle, pickup truck, other truck, recreational vehicle, motorcycle or other POV. The vehicle does not need to belong to the household.

Trips made in other highway vehicles, such as buses, streetcars, taxis, and school buses are collected in the NHTS, but these are shown as person trips by those modes. The design of the NHTS is such that it does not serve as a source for vehicle trips in modes such as buses, because there is no way to trace the movement of the bus fleet throughout the day. Those interested in vehicle trips by buses, taxis, etc. need to use a data source that relies on reports from the fleet operators of those vehicles. The National Transit Database of the Federal Transit Administration is one such source.

**WHEN TO USE** - The unit of vehicle trips is most appropriately used when considering POV travel, e.g., “20 percent of all POV trips are for commuting to and from work.”

**HOW TO COMPUTE** - The variable DRVR\_FLG was created to allow the data user to select the vehicle trip records from the travel day file. The typical manner of computing vehicle trips from the NHTS file is to impose two limits on the full universe of Travel Day trips:

- travel mode must be POV (TRPTRANS = 01 -07), and
- only the driver’s trip is captured (DRVR\_FLG = 01).

The second limitation is to insure that the trip is counted only once. Remember that the NHTS Travel Day file is a person trip file, so if three household members went somewhere by car, that trip is reflected in three travel day trip records. To ensure that it is only counted once as a vehicle trip, the driver’s record is used.

To obtain the total of all vehicle trips, sum all weighted trips that meet the two conditions above, i.e., where DRVR\_FLG=1.

**VEHICLE  
MILES OF  
TRAVEL (VMT)**

**DEFINITION** - One vehicle mile of travel is the movement of one privately operated vehicle (POV) for one mile, regardless of the number of people in the vehicle.

**EXAMPLES** - When one person drives her car 12 miles to work, 12 vehicle miles of travel have been made. If two people travel three miles by pickup, three vehicle miles of travel have been made.

**SAME MODE RESTRICTIONS** - For NHTS data, vehicle miles are restricted to the same privately-operated vehicles as vehicle trips(see above), that is a household-based car, van, sport utility vehicle, pickup truck, other truck, recreational vehicle, or other POV. .

**WHEN TO USE** - Vehicle miles of travel (VMT) are a very commonly used measure of highway travel. This measure is particularly important when analyzing highway capacity, congestion and air quality.

**HOW TO COMPUTE** - Multiply each weighted vehicle trip by the distance. In terms of NPTS variables, this would look like (DRVR\_FLG=1 times WTTRDFIN) times TRPMILES.

**WARNING** - When computing TRPMILES, be sure to exclude entries of:

- 1 question not applicable,
- 7 miles refused,
- 8 miles not known, and
- 9 miles not ascertained.

**VEHICLE  
OCCUPANCY**

**DEFINITION** - For NHTS data, vehicle occupancy is generally computed as person miles of travel per vehicle mile (referred to as the travel method). Note that the other commonly-used definition of vehicle occupancy is persons per vehicle trip (referred to as the trip method) .

**COMMENTS** - Because longer trips often have higher occupancies, the travel method generally yields a higher rate than the trip method. The calculation of the travel method requires that trip miles be reported, thus it is calculated on a slightly smaller number of trips than the trip method.

**HOW TO COMPUTE** - The four variables that may be used in the computation are described earlier in this section. Just remember to limit the denominator to person trips or person miles in POVs.

## **GLOSSARY**

This glossary provides the most common terms used in the NHTS and definitions of those terms. These definitions are provided to assist the user in the interpretation of the NHTS data.

### **Adult**

For NHTS, this is defined as a person 18 years or older.

### **Block Group**

A subdivision of a Census tract that averages 1000 to 1100 people, and approximately 400-500 housing units. The source used for the 2001 NHTS was GDT Dynamap 2000 (from Census 2000 TIGER/Line files)

### **Census Region and Division**

The Census Bureau divides the states into four regions and nine divisions. Note that the divisions are wholly contained within a region, i.e., region lines do not split division lines. The regions and their component divisions are:

#### Northeast Region

- New England Division: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont
- Middle Atlantic Division: New Jersey, New York, Pennsylvania

#### North Central (Midwest) Region

- East North Central Division: Illinois, Indiana, Michigan, Ohio, Wisconsin
- West North Central Division: Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, South Dakota

#### South Region

- South Atlantic Division: Delaware, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia, West Virginia
- East South Central Division: Alabama, Kentucky, Mississippi, Tennessee
- West South Central Division: Arkansas, Louisiana, Oklahoma,

## Texas

### West Region

- Mountain Division: Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, Wyoming
- Pacific Division: Alaska, California, Hawaii, Oregon, Washington

### Puerto Rico

For the 2001 NHTS the source used for the 2000 Census Region was:<http://www.census.gov/geo/www/cob/rg2000.html>

The source used for the 2000 Census Division was:  
<http://www.census.gov/geo/www/cob/dv2000.html>

### **Census Tract**

A small subdivision of a county, containing approximately 4,000 persons. Tracts can range in population from 2,500 to 8,000. The geographic size of the tract may vary considerably, depending on population density. Tracts were designed to be homogeneous in regard to population characteristics, economic status and living conditions when they were first delineated. Since the first tracts were delineated for the 1890 Census, today's tracts may be far from homogeneous. The source used for the 2001 NHTS was GDT Dynamap 2000 (from Census 2000 TIGER/Line files).

### **Consolidated Metropolitan Statistical Area (CMSA)**

A large metropolitan complex of 1 million or more population, containing two or more identifiable component parts designated as primary metropolitan statistical areas (PMSAs). For example, the Boston CMSA is composed of six PMSAs.

### **Destination**

For travel day trips, the destination is the point at which there is a break in travel, except if the break is only to change vehicles or means of transport. For travel period trips, the destination is the farthest point of travel from home.

### **Driver**

A driver is a person who operates a motorized vehicle. If more than one person drives on a single trip, the person who drives the most miles is classified as the principal driver.

**Employed** A person is considered employed if (s)he worked for pay, either full time or part time, during the week before the interview.

**Education Level** The number of years of regular schooling completed in graded public, private, or parochial schools, or in colleges, universities, or professional schools, whether day school or night school. Regular schooling advances a person toward an elementary or high school diploma, or a college, university, or professional school degree.

**Household** A group of persons whose usual place of residence is a specific housing unit; these persons may or may not be related to each other. The total of all U.S. households represents the total civilian non-institutionalized population. A household does not include group quarters (i.e., 10 or more persons living together, none of whom are related).

**Household Income** Household income is the money earned by all family members in a household, including those temporarily absent. Annual income consisted of the income earned 12 months preceding the interview. Household income includes monies from all sources, such as wages and salary, commissions, tips, cash bonuses, income from a business or farm, pensions, dividends, interest, unemployment or workmen's compensation, social security, veterans' payments, rent received from owned property (minus the operating costs), public assistance payments, regular gifts of money from friends or relatives not living in the household, alimony, child support, and other kinds of periodic money income other than earnings. Household income excludes in-kind income such as room and board, insurance payments, lump-sum inheritances, occasional gifts of money from persons not living in the same household, withdrawal of savings from banks, tax refunds, and the proceeds of the sale of one's house, car, or other personal property.

Household income has been provided in two variables. HHINCTTL is the variable that reflects the basic household income (HHFAMINC) plus the income of household members that were not reported in HHFAMINC but instead reported separately (INC\_Pn, INCM\_Pn). The purpose of creating HHINCTTL is to provide a more accurate level of household income for those households where some members reported separate income. HHFAMINC was the main income variable in the earlier NPTS series. When

comparing 2001 data to the earlier surveys, conducted in 1969, 1977, 1983, 1990 and 1995, use HHFAMINC. Appendix D provides details on how these variables were created.

**Household Members**

Household members include all people, whether present or temporarily absent, whose usual place of residence is in the sample unit. Household members also include people staying in the sample unit who have no other usual place of residence elsewhere.

**Household Vehicle**

A household vehicle is a motorized vehicle that is owned, leased, rented or company-owned and available to be used regularly by household members. Household vehicles include vehicles used solely for business purposes or business-owned vehicles, so long as they are driven home and can be used for the home to work trip, (e.g., taxicabs, police cars, etc.). Household vehicles include all vehicles that were owned or available for use by members of the household during the travel period, even though a vehicle may have been sold before the interview. Vehicles excluded from household vehicles are those that were not working and were not expected to be working, and vehicles that were purchased or received after the designated travel day.

**Means of Transportation**

A mode of travel used for going from one place (origin) to another (destination). A means of transportation includes private and public modes, as well as walking.

The following transportation modes, grouped by major mode, are included in the NHTS data. The numbers correspond to the code for the mode in the NHTS questionnaire (see Appendix J).

**Private Vehicle**

1. Car. A privately owned and/or operated licensed motorized vehicle including cars and station wagons. Leased and rented cars are included if they are privately operated and not used for picking up passengers in return for fare.
2. Van. A privately owned and/or operated van or minivan designed to carry 5 to 13 passengers, or to haul cargo.
3. Sport Utility Vehicle. A privately owned and/or operated vehicle that is a hybrid of design elements from a van, a pickup truck and a station wagon. Examples include a Chevrolet Blazer, Ford Bronco, Jeep Cherokee, or Nissan Pathfinder.

4. Pickup Truck. A pickup truck is a motorized vehicle, privately owned and/or operated, with an enclosed cab that usually accommodates 2-3 passengers, and an open cargo area in the rear. Later model pickups often have a back seat that allows for total seating of 4 -6 passengers. Pickup trucks usually have the same size of wheel-base as a full-size station wagon. This category also includes pickups with campers.
5. Other Truck: This category consists of all trucks other than pickup trucks (i.e., dump trucks, trailer trucks, etc.).
6. RV or Motor Home: An RV or motor home includes a self-powered recreational vehicle that is operated as a unit without being towed by another vehicle (e.g., a Winnebago motor home).
7. Motorcycle: This category includes large, medium, and small motorcycles and mopeds.

#### Public Transportation

10. Local public transit buses (mass transit buses that are available to the general public)
11. Commuter buses.
16. Commuter train.
17. Subway/Elevated rail (also know as rail rapid transit is a high capacity system operated on a fixed rail or guide way system on a private right of way).
18. Street car/Trolley (vehicles that run on a fixed rail system powered by electricity obtained from an overhead power distribution system).

#### Other Modes

8. Commercial/Charter Airplane (airplanes that are available for use by the general public in exchange for a fare).
9. Private/Corporate Airplanes.
12. School Buses.
13. Charter/Tour buses (privately owned buses that are either rented by a group or are available to the public for a fee for sightseeing).
14. City to City Buses (buses that run from one urban center to the other).
15. Amtrak/Intercity Train (heavy passenger rail that runs form one urban center to another).
19. Ship/Cruise Ships.
20. Passenger Line /Ferry.
21. Sailboat/Motorboat/Yacht.
22. Taxicab (include the use of a taxicab by a passenger for fare.

The taxi category does not include rental cars if they are privately operated).

- 23. Limousine (includes the use of a limousine by passenger for fare. The limousine category does not include rental cars if they are privately operated.)
- 24. Hotel/Airport Shuttle (includes privately operated shuttle buses that are operated between a limited number of points for a fare).
- 25. Bicycle (includes bicycles of all speeds and sizes that do not have a motor).
- 26. Walk (includes walking and jogging).
- 91. Other. Includes any types of transportation not previously listed, e.g. skate boards.

**Metropolitan Statistical Area (MSA)**

Except in the New England States, a Metropolitan Statistical Area is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition, contiguous counties are included in an MSA if, according to certain criteria, they are socially and economically integrated with the central city. In the New England States, MSA's consist of towns and cities instead of counties. The source used for the 2001 NHTS was 1999 Metropolitan Areas: Cartographic Boundary Files. File ma99\_99.shp from <http://www.census.gov/geo/www/cob/ma1999.html>.

**Motorized Vehicle**

Motorized vehicles are all vehicles that are licensed for highway driving.

**Occupancy**

Occupancy is the number of persons, including driver and passenger(s) in a vehicle. NHTS occupancy rates are generally calculated as person miles divided by vehicle miles.

**Origin**

Origin is the starting point of a trip.

**Overlap Trip**

A travel period trip that occurs on travel day, and is thus collected in both portions of the NHTS questionnaire. To ensure that this trip is not counted twice, eliminate overlap trips from travel day data when travel day and travel period data will be added together.

<b>Passenger</b>	For a specific trip, a passenger is any occupant of a motorized vehicle, other than the driver.
<b>Person Miles of Travel (PMT)</b>	PMT is a primary measure of person travel. When one person travels one mile, one person mile of travel results. Where 2 or more persons travel together in the same vehicle, each person makes the same number of person miles as the vehicle miles. Therefore, four persons traveling 5 miles in the same vehicle results in 20 person miles ( $4 \times 5 = 20$ ).
<b>Person Trip</b>	A person trip is a trip by one or more persons in any mode of transportation. Each person is considered as making one person trip. For example, four persons traveling together in one auto are counted as four person trips.
<b>POV</b>	A privately-owned vehicle or privately-operated vehicle. Either way, the intent here is that this is not a vehicle available to the public for a fee, such as a bus, subway, taxi, etc.
<b>Travel Day</b>	A travel day is a 24-hour period from 4:00 a.m. to 3:59 a.m. designated as the reference period for studying trips and travel by members of a sampled household.
<b>Travel Period</b>	A travel period consists of a four-week period ending with the travel day.
<b>Travel Day Trip</b>	A travel day trip is defined as any time the respondent went from one address to another by private motor vehicle, public transportation, bicycle, walking, or other means. However, a separate trip is not counted in two instances: <ol style="list-style-type: none"> <li>1. When the sole purpose for the trip is to get to another vehicle or mode of transportation in order to continue to the destination.</li> <li>2. Travel within a shopping center, mall or shopping areas of 4-5 blocks is to be considered as travel to one destination.</li> </ol>
<b>Travel Period Trip</b>	A travel period trip is a trip where the farthest destination is at least 50 miles from home. The outgoing portion of this trip can take

place at any time, but the return must be within the four-week travel period. The four-week travel period ends on and includes the assigned travel day.

**Travel Day  
Trip Purpose**

A trip purpose is the main reason that motivates a trip. There are 36 travel day trip purposes used in the 2001 NHTS.

For the 2001 Survey, trip purposes were collected using a From-To approach. For each trip, the origin and destination are on the file in generic terms, e.g. from work to shopping. The 36 trip reasons are defined as follows:

1. To Home. Travel to home after leaving for some reason.
2. Go to Work. The first trip to the work location on travel day.
3. Return to Work. A trip to work that is not the first trip to work on the travel day.
4. Attend Business Meeting/Trip. A work related trip whose purpose is to attend a business meeting.
5. Other Work Related. A work related trip whose purpose is not specifically to attend a business meeting.
6. Go to School as a Student. A trip whose purpose is to go to school as a student.
7. Go to Religious Activity. A trip whose purpose is to go to a place to attend a religious activity.
8. Go to Library, School Related. A trip whose purpose is to go to the library as part of a school related activity.
9. Go to Daycare. A trip whose purpose is to attend day care.
10. Other School/Religious Activity. School and religious activities not covered by categories 6 through 8 above.
11. Medical/Dental Services. A trip made for medical, dental, or mental health treatment, or other related professional services.
12. Buy Goods, (e.g., groceries/clothing/hardware store). A shopping trip whose purpose is to purchase commodities for use or consumption elsewhere. This purpose also includes window-shopping and trip made to shop even if nothing is purchased.
13. Buy Services, (e.g., video rentals/dry cleaning/post office/car service/bank). The category includes the purchase of services other than medical/dental or other professional services.
14. Buy Gas. A trip made specifically to get gas.
15. Shopping/Errands. Shopping/errand trips not covered by categories 12 through 14 above.
16. Go to the Gym/Exercise/Play Sports. A trip made for exercise

- or to participate in a sport.
17. Rest or Relaxation/Vacation.
  18. Visit Friends/Relatives. The social/recreational trip whose purpose is to visit with family and friends.
  19. Go out/Hang out, Entertainment/Theater/Sports Event/Go to Bar. The purpose of the trip is entertainment or hanging out with friends.
  20. Visit Public Place, Historical Site/Museum/Park/Library.
  21. Social/Recreational. Includes social and recreational trips not covered by categories 16 through 20 above.
  22. Use Professional Services, Attorney/Accountant. A trip made for professional services other than for medical/dental purposes.
  23. Attend Funeral/Wedding. A personal trip to attend a funeral or a wedding.
  24. Use Personal Services, Grooming/Haircut/Nails. A trip for personal services such as to a hairdresser.
  25. Pet Care, Walk the dog/Vet visits.
  26. Attend Meeting, PTA/Home Owners Association/Local Government. The purpose of the trip is to attend a non-work related meeting, such as a community meeting.
  27. Family Personal Business/Obligations. A trip for personal business not covered by categories 22 through 26 above.
  28. Pickup Someone.
  29. Take and Wait. A trip made to take someone to a destination and then wait with them at the destination and return together.
  30. Drop Someone Off.
  31. Transport Someone. Trips with a passenger that are related to picking up or dropping off someone but not covered by categories 28 through 30.
  32. Social Event. A trip whose purpose is to eat a meal at a social event.
  33. Get/Eat Meal. A trip whose purpose is to get and eat a meal but not at a social event.
  34. Coffee/Ice Cream/Snacks. A trip whose purpose is to get/eat a snack or drink, something less than a meal.
  35. Meals. A trip whose purpose is to eat or get a meal but not covered by categories 32 through 34 above.
  36. Other. A trip purpose not covered by categories 1 through 36 above.

For more on trip purpose coding and variables, see Appendix M.

<b>Travel Period Trip Purpose</b>	A trip purpose is the main reason that motivates a trip. There were 18 travel period trip purposes in the 2001 NHTS. The main reason and all other reasons for the trip were collected.
<b>Urbanized Area</b>	<p>An urbanized area consists of the built up area surrounding a central core (or central city), with a population density of at least 1,000 persons per square mile. Urbanized areas do not follow jurisdictional boundaries thus it is common for the urbanized area boundary to divide a county.</p> <p>For the 2001 NHTS, Urban Areas were calculated two ways.</p> <ul style="list-style-type: none"> <li>• Variable URBAN uses the 2000 Urbanized Areas: Cartographic Boundary Files. File ua00_d00.shp from <a href="http://www.census.gov/geo/www/cob/ua2000.html">http://www.census.gov/geo/www/cob/ua2000.html</a>. Four codes are used. 1 = in Urban Cluster, 2 = in Urban Area, 3 = in area surrounded by urban areas. 4 = not in Urban Area,</li> <li>• Variable URBRUR uses the 2000 Urbanized Areas: Cartographic Boundary Files. File ua00_d00.shp from <a href="http://www.census.gov/geo/www/cob/ua2000.html">http://www.census.gov/geo/www/cob/ua2000.html</a>. Two codes are used: 1 = in Urban Area, 2 = Rural (Not in Urban Area).</li> </ul>
<b>Vehicle</b>	The 2001 NHTS, the term vehicle includes autos, passenger vans, sport utility vehicles, pickups and other light trucks, RV's, motorcycles and mopeds owned or available to the household.
<b>Vehicle Miles of Travel (VMT)</b>	VMT is a unit to measure vehicle travel made by a private vehicle, such as an automobile, van, pickup truck, or motorcycle. Each mile traveled is counted as one vehicle mile regardless of the number of persons in the vehicle.
<b>Vehicle Occupancy</b>	Vehicle occupancy is the number of persons, including driver and passenger(s) in a vehicle; also includes persons who did not complete a whole trip. NHTS occupancy rates are generally calculated as person miles divided by vehicle miles.
<b>Vehicle Trip</b>	A trip by a single privately-operated vehicle (POV) regardless of the number of persons in the vehicle.
<b>Vehicle Type</b>	For purposes of the 2001 NHTS, one of the following:

1. Automobile (including station wagon)
2. Van
3. Sport Utility Vehicle
4. Pickup Truck (including pickup with camper)
5. Other Truck
6. RV or Motor Home
7. Motorcycle
8. Other

See “Means of Transportation” for definitions of these vehicle types. For NHTS, vehicle types are limited to privately operated vehicles (POV) because other vehicles that the respondent may have rode in (e.g., bus) were not tracked throughout the day, as was the case with household vehicles.

**Worker**

See “Employed”.

<b>Variable</b>	<b>Sample Size</b>	<b>Weighted Sum (1000000's)</b>	<b>Lower 95% Confidence Interval Estimate* (1000000's)</b>	<b>Upper 95% Confidence Interval Estimate* (1000000's)</b>	<b>File Processed</b>	<b>Comments</b>
Vehicle Trips (travel day)	387,428	233,040	230,966	235,114	Travel Day	Sum over WTTRDFIN where DRVR_FLG='1', POV only.
Vehicle Miles of Travel (VMT) **	384,732	2,274,797	2,231,694	2,317,901	Travel Day	Sum over TRPMILES weighted with WTTRDFIN where TRPMILES >= 0, DRVR_FLG='1', POV only.

\* The Upper 95% confidence interval is calculated by adding two standard errors to the Weighted Sum and the Lower 95% confidence interval is calculated by subtracting two standard errors from the Weighted Sum.

\*\* Sample sizes for Person Miles of Travel and Vehicle Miles of Travel are for trips with miles reported.

# APPENDIX G

## STANDARD TABLES AND LOGIC

The Excel file named “APPENDIX G.xls” contains one worksheet for each of the commonly requested tables listed below. For each cell, the table contains the sample size (unweighted number of cases), weighted size, and the standard error of the weighted estimate. Standard errors are more important when sample sizes are smaller. The cells of the tables show the standard errors for subsets of the data.

Table 1: Number of Households by Household Income and Household Vehicles

Table 2: Number of Household Vehicles by Vehicle Age and Type

Table 3: Number of Persons in Households, by Age and Sex

Table 4: Number of Drivers by Annual Miles Driven, Age and Sex

Table 5: Number of Workers by Work Trip Time and MSA Size

Table 6: Number of Travel Day Person Trips, by Mode and Purpose

Table 7: Average Number of Travel Day Trips per Person, by Age and Sex  
(NOTE: The rates in this table are per travelling person. Persons who made no travel day trips are excluded from the rates shown here.)

Table 8: Number of Travel Day Person Miles Traveled, by Mode and Purpose

Table 9: Number of Travel Day Vehicle Trips, by Trip Length and Purpose (POV Only)

Table 10: Number of Travel Day Vehicle Miles Traveled, by Trip Length and Purpose (POV Only)

Table 12: Average Vehicle Occupancy, by Trip Length and Purpose (POV Only)  
(NOTE: The rates in this table are computed as POV person trips divided by vehicle trips. A different rate will be obtained if POV person miles are divided by vehicle miles of travel.)

## Appendix G Notes

- Table 2: The age of the vehicle was determined by subtracting the year of the vehicle from the year of the household interview. For example, if the household interview was completed in 2001 and the vehicle was a 1998 model, the age of the vehicle would be 3 years old (2001–1998=3).
- Table 6: POV travel includes car, van, SUV, pickup or other truck, RV, or motorcycle. Bus includes public transit, commuter bus, school, or charter. Train includes Amtrak, commuter train, subway/rail, or street car. Other includes taxi, limo, shuttle, bicycle, and other modes.
- Table 8: POV travel includes car, van, SUV, pickup or other truck, RV, or motorcycle. Bus includes public transit, commuter bus, school, or charter. Train includes Amtrak, commuter train, subway/rail, or street car. Other includes taxi, limo, shuttle, bicycle, and other modes. Sample size reflects the number of travel day trips with miles reported.
- Table 9: The trip distance for eighteen records fell between the “0-5” and “6-10” mile categories. The trip distance for these eighteen records was rounded down to 5 or up to 6 so they could be categorized. POV travel includes car, van, SUV, pickup or other truck, RV, or motorcycle.
- Table 10: The trip distance for eighteen records fell between the “0-5” and “6-10” mile categories. The trip distance for these eighteen records was rounded down to 5 or up to 6 so they could be categorized. The weighted sum shown in Table 10 (wgt=2,274,801,227,000) will differ slightly from the weighted sum reported in Appendix F, Table 5 (wgt=2,274,797,000,000) due to the rounding of these eighteen trip distances. POV travel includes car, van, SUV, pickup or other truck, RV, or motorcycle.
- Table 12: This table reflects a trip-based occupancy rate (i.e. persons per vehicle trip), as opposed to a mileage-based occupancy rate (i.e. person miles per vehicle mile). The trip distance for eighteen records fell between the “0-5” and “6-10” mile categories. The trip distance for these eighteen records was rounded down to 5 or up to 6 so they could be categorized. POV travel includes car, van, SUV, pickup or other truck, RV, or motorcycle.

This table reflects a trip-based occupancy rate (i.e. persons per vehicle trip), as opposed to a mileage-based occupancy rate (i.e. person miles per vehicle mile).

# APPENDIX H

## DEFINING NON RESPONSE ADJUSTMENT CELLS

### H-1. VARIABLES USED TO DEFINE NONRESPONSE ADJUSTMENT CELLS FOR FULL SAMPLE

In Chapter 5 we discussed the steps in the calculation of the household and person weights for the 2001 NHTS. As mentioned in this chapter, we made adjustments to the weights for nonresponse. The nonresponse adjustment had to be done separately for each weight, because there are households that are considered as respondents for useable households (i.e., 50% or more of household adults interviewed) that are non respondents for 100% reported households. In the nonresponse adjustment, cells were formed, with a separate nonresponse adjustment factor applied for each cell. These were examined to determine where response rates differed. The variables for which response rates differed significantly are listed here. These differ for the full sample weighting and for the national sample weighting. The variables for the full sample are listed below. The variables for the national sample follow in Section H-2.

#### Household Interview

Address Flag (1, 2)

- 1 = Address matched to address lists
- 2 = Address not matched to address lists

Site ID (0, 1, 2, 3, 4, 5, 6, 7, 8, 9)

- 1 = Lancaster
- 2 = Baltimore
- 3 = Kentucky
- 4 = Des Moines
- 5 = Texas
- 6 = Hawaii
- 7 = Oahu
- 8 = New York
- 9 = Wisconsin
- 0 = the rest of the country

Median Home Value (1, 2, 3, 4)

- 1 = Median Home Value < Q1

- 2 = Median Home Value between Q1 and Median
- 3 = Median Home Value between Median and Q3
- 4 = Median Home Value > Q3

Percent White (1, 2)

- 1 = Percent White < Median of the Percentages
- 2 = Percent White > Median of the Percentages

Percent Hispanic (1; 2)

- 1 = Percent Hispanic < Median of the Percentages
- 2 = Percent Hispanic > Median of the Percentages

MSA Central City (0, 1, 2)

- 0 = Non-MSA
- 1 = MSA – Central City
- 2 = MSA – Non-Central City

Percent Owner Occupied Housing Unit (1; 2)

- 1 = Percent Owner Occupied < Median of the Percentages
- 2 = Percent Owner Occupied > Median of the Percentages

Census Region (1; 2; 3; 4)

- 1 = North East
- 2 = North Central
- 3 = South
- 4 = West

Percent Age 25 - 34 (1, 2)

- 1 = Percent Age 25 - 34 < Median of the Percentages
- 2 = Percent Age 25 – 34 > Median of the Percentages

Percent Black (1, 2)

- 1 = Percent Black < Median of the Percentages
- 2 = Percent Black > Median of the Percentages

Percent College Graduate (1, 2)

- 1 = Percent College Graduate < Median of the Percentages
- 2 = Percent College Graduate > Median of the Percentages

Median Household Income (1; 2)

- 1 = Median Household Income < Median of the Medians
- 2 = Median Household Income > Median of the Medians

Median Years of Education (1, 2)

- 1 = Median Years of Education < Median of the Medians
- 2 = Median Years of Education > Median of the Medians

Percent Age 65+ (1, 2)

1 = Percent Age 65 + < Median of the Percentages

2 = Percent Age 65+ > Median of the Percentages

Notes: Variables for these Household Nonrespondent Adjustment Cells are the RDD frame variables. Median of the Percentages for a particular variable refers to the median value of the set of percentages provided for that variable by the telephone sample vendor for all telephone exchanges in the country for which the vendor has data. Median of the Medians for a particular variable similarly refers to the median value of the set of median values provided for that variable by the telephone sample vendor for all telephone exchanges in the country for which the vendor has data.

### **Household Weighting for 100% Adults Reported Households**

Address Flag (1, 2) – Frame

Site ID (0, 1, 2, 3, 4, 5, 6, 7, 8, 9) - Household interview

Number of Adults in the Household (1, 2, 3 or more) - Household interview

Household Size (1, 2, 3, 4 or more) - Household interview

Ethnicity of the Reference Person – (Hispanic/Non-Hispanic) - Household interview

Home Ownership – (Owner/Renter) - Household interview

Race of the Reference Person – (Black/Non-Black) - Household interview

Percent White (1, 2) - Frame

Percent Black (1, 2) - Frame

MSASIZE (1, 2, 3, 4, 5, 6) – Household interview

1. In an MSA (or a CMSA) less than or equal to 249,999

2. In an MSA (or a CMSA) 250,000 – 499,999

3. In an MSA (or a CMSA) 500,000 – 999,999

4. In an MSA (or a CMSA) 1,000,000 – 2,999,999

5. In an MSA (or a CMSA) greater than or equal to 3,000,000

6. Not in MSA nor in CMSA

Census Region (1, 2, 3, 4) - Household interview

Kids in the Household – (Yes or No) - Household interview

Age Category (1, 2, 3) - Household interview

## **Person Weighting for at Least 50% Adults Reported Households**

Address Flag (1, 2) – Frame

Site ID (0, 1, 2, 3, 4, 5, 6, 7, 8, 9) - Household interview

MSASIZE (1, 2, 3, 4, 5, 6) – Household interview

1. In an MSA (or a CMSA) less than or equal to 249,999

2. In an MSA (or a CMSA) 250,000 – 499,999

3. In an MSA (or a CMSA) 500,000 – 999,999

4. In an MSA (or a CMSA) 1,000,000 – 2,999,999

5. In an MSA (or a CMSA) greater than or equal to 3,000,000

6. Not in MSA nor in CMSA

Number of Adults in the Household (1, 2, 3 or more) - Household interview

Household Size (1, 2, 3, 4 or more) - Household interview

Home Ownership – (Owner/Renter) - Household interview

Race of the Reference Person – (Black/Non-Black) - Household interview

MSA Category (1, 2, 3, 4) - Household interview

Home Type – (Detached Single House/Other) - Household interview

Census Region (1, 2, 3, 4) - Household interview

Number of Vehicles in the Household (0, 1, 2 or more) - Household interview

Median Years of Education (1, 2) - Frame

Sex (Male/Female) - Household interview

Age Category (1, 2, 3) - Household interview

Median Home Value (1; 2) – Frame

## **H-2. VARIABLES USED TO DEFINE NONRESPONSE ADJUSTMENT CELLS FOR NATIONAL SAMPLE**

### **Household Interview**

Median Home Value (1, 2, 3, 4)

- 1 = Median Home Value < Q1
- 2 = Median Home Value between Q1 and Median
- 3 = Median Home Value between Median and Q3
- 4 = Median Home Value > Q3

Percent White (1, 2)

- 1 = Percent White < Median of the Percentages
- 2 = Percent White > Median of the Percentages

Percent Hispanic (1; 2)

- 1 = Percent Hispanic < Median of the Percentages
- 2 = Percent Hispanic > Median of the Percentages

MSA Central City (0, 1, 2)

- 0 = Non-MSA
- 1 = MSA – Central City
- 2 = MSA – Non-Central City

Percent Owner Occupied Housing Unit (1; 2)

- 1 = Percent Owner Occupied < Median of the Percentages
- 2 = Percent Owner Occupied > Median of the Percentages

Census Region (1; 2; 3; 4)

- 1 = North East
- 2 = North Central
- 3 = South
- 4 = West

Percent Age 25 - 34 (1, 2)

- 1 = Percent Age 25 - 34 < Median of the Percentages
- 2 = Percent Age 25 – 34 > Median of the Percentages

Percent Black (1, 2)

- 1 = Percent Black < Median of the Percentages
- 2 = Percent Black > Median of the Percentages

Percent College Graduate (1, 2)

- 1 = Percent College Graduate < Median of the Percentages
- 2 = Percent College Graduate > Median of the Percentages

Median Household Income (1; 2)

1 = Median Household Income < Median of the Medians

2 = Median Household Income > Median of the Medians

Median Years of Education (1, 2)

1 = Median Years of Education < Median of the Medians

2 = Median Years of Education > Median of the Medians

Percent Age 65+ (1, 2)

1 = Percent Age 65 + < Median of the Percentages

2 = Percent Age 65+ > Median of the Percentages

Notes: Variables for these Household Nonrespondent Adjustment Cells are the RDD frame variables. Median of the Percentages for a particular variable refers to the median value of the set of percentages provided for that variable by the telephone sample vendor for all telephone exchanges in the country for which the vendor has data. Median of the Medians for a particular variable similarly refers to the median value of the set of median values provided for that variable by the telephone sample vendor for all telephone exchanges in the country for which the vendor has data.

### **Household Weighting for at Least 50% Adults Reported Households**

Number of Adults in the Household (1, 2, 3 or more) - Household interview

Household Size (1, 2, 3, 4 or more) - Household interview

Ethnicity of the Reference Person – (Hispanic/Non-Hispanic) - Household interview

Home Ownership – (Owner/Renter) - Household interview

Race of the Reference Person – (Black/Non-Black) - Household interview

Percent Black (1, 2) - Frame

MSA Category (1, 2, 3, 4) - Household interview

1 = MSA greater than or equal to 1 million with a rail transit system

2 = MSA greater than or equal to 1 million with no rail transit system

3 = MSA less than 1 million population

4 = Non-MSA

Home Type – (Detached Single/Other) - Household interview

Census Region (1, 2, 3, 4) - Household interview

Percent Age 65+ (1, 2) - Frame

Number of Vehicles in the Household (0, 1, 2 or more) - Household interview

Median Years of Education (1, 2) - Frame

Median Home Value (1, 2, 3, 4) - Frame

Percent Hispanic (1, 2) - Frame

### **Household Weighting for 100% Adults Reported Households**

Number of Adults in the Household (1, 2, 3 or more) - Household interview

Household Size (1, 2, 3, 4 or more) - Household interview

Ethnicity of the Reference Person – (Hispanic/Non-Hispanic) - Household interview

Home Ownership – (Owner/Renter) - Household interview  
Race of the Reference Person – (Black/Non-Black) - Household interview  
Percent White (1, 2) - Frame  
Percent Black (1, 2) - Frame  
MSA Category (1, 2, 3, 4) – Household interview  
    1 = MSA greater than or equal to 1 million with a rail transit system  
    2 = MSA greater than or equal to 1 million with no rail transit system  
    3 = MSA less than 1 million population  
    4 = Non-MSA  
Home Type – (Detached Single/Other) - Household interview  
Census Region (1, 2, 3, 4) - Household interview  
Kids in the Household – (Yes or No) - Household interview  
Percent Age 65+ (1 [<median], 2 [>median]) - Frame

# **APPENDIX I**

## **UNWEIGHTED SURVEY RESPONSE RATES**

### **I-1. OVERVIEW**

Chapter 4 presented weighted response rates for the 2001 NHTS. This appendix presents unweighted survey response rates and the details of how those rates were determined. Unweighted response rates may be useful for comparison to similar unweighted response rates presented in the user's documentation for the 1995 and earlier implementations of the Nationwide Personal Transportation Survey. A summary of the overall unweighted response rates, as well as the rates at key stages of the survey process are documented in this section.

For the 2001 NHTS, the overall CASRO unweighted response rate for useable households was 41 percent for the national sample. The CASRO response rate for the full sample which included the national sample and 9 add-on regions was 32 percent. This included all households considered useable (persons interviews were conducted for at least half of the household members 18 and older), which are the households (and people within those households) comprising the final data set. Note that the full sample's lower unweighted response rate is due to the impact of the lower response rates obtained in several of the add-on samples. This influence, explained in Chapter 4, underscores the importance of the need for weighted response rates.

### **I-2. CLASSIFICATION OF ALL TELEPHONE NUMBERS USED**

The first step in the calculation of response rates is to classify all telephone numbers in the sample into residential (in-scope) and non-residential/non-working (out-of-scope) totals. Table I-1 displays the final classification of all telephone numbers in the 2001 NHTS full sample and national sample at the household level. The total number of telephone numbers used to achieve the 106,598 completed household interviews in the full sample was 568,796. For the national sample a total of 152,191 telephone numbers was used. These numbers fall into three main groups:

- Numbers that are in-scope. Telephone screening showed that 33.1 percent (188,395 numbers) of the full sample was residential. Interviewers completed household interviews with 106,598 households, yielding a household completion rate of 56.6 percent. For the national sample, 36,810 household interviews were completed resulting in a completion rate of 64.0 percent. Westat considered a household interview complete if the interviewer administered all questions in the household interview and was able to set an appointment to call back to complete person interviews in the household. The detailed breakdowns for refusals, households that reached the maximum call limit, language problems, and other non-interviews were not obtained for some of the add-on locations, thus these are shown as “not available” in the table for the full sample.
- Numbers that are out-of-scope. Over half the telephone numbers in the samples (full sample: 53.7 percent, national sample: 52.8 percent) were found to be either non-working or non-residential. The detailed breakdown of out-of-scope households was not obtained for some of the add-on locations, thus these are shown as “not available” in the table for the full sample.
- Numbers whose eligibility is unknown. At the end of data collection, the residency status of 13.2 percent of the full sample (9.4 percent of the national sample) was not determined.

**Table I-1. Classification of Telephone Numbers in the Sample After Completion of the Household Interview**

Household Interview Classification Result	Full Sample		National Sample	
	Number	Percent	Number	Percent
In-Scope - Total	188,395	33.1%	57,506	37.8%
Completed Household Interviews	106,598	18.7%	36,810	24.2%
<i>Refusals</i>	<i>Not Available</i>	<i>Not Available</i>	13,904	9.1%
<i>Maximum Call Attempts Reached</i>	<i>Not Available</i>	<i>Not Available</i>	5,392	3.5%
<i>Language or Communication Barrier</i>	<i>Not Available</i>	<i>Not Available</i>	1,309	0.9%
<i>Other Non-Interview</i>	<i>Not Available</i>	<i>Not Available</i>	98	0.1%
All Non-Interviews	81,797	14.4%	20,703	13.6%
Out-of-Scope - Total	305,354	53.7%	80,379	52.8%
Non-working	Not Available	Not Available	60,654	39.8%
Non-residential	Not Available	Not Available	19,814	13.0%
Group Quarters	Not Available	Not Available	1	0.0007%
Eligibility Unknown - Total	75,047	13.2%	14,306	9.4%
Answering Machines	Not Available	Not Available	4,071	2.7%
No Answer	Not Available	Not Available	10,235	6.7%
Total Telephone Numbers in Sample	568,796	100%	152,191	100%

**I-3. HOUSEHOLD INTERVIEW UNWEIGHTED RESPONSE RATE**

The overall survey response rate is a product of the response rate for the household interview and the response rate for the person interview. In this section we calculate the unweighted household interview response rates.

In order to calculate the household interview response rate, it is necessary to estimate the residency status of the telephone numbers in Table I-1 whose eligibility was unknown at the end of data collection. Westat used the Council of American

Survey Research Organizations (CASRO) method<sup>1</sup> to determine the residency rate for the telephone numbers coded as "answering machines" or "no answers." This method assumes that the residency rate for the numbers whose eligibility is unknown is similar to the rate for those numbers whose eligibility is known. Therefore, the residency rate was calculated as follows:

$$\frac{\text{Number of In-Scope Telephone Numbers}}{\text{Number with Scope Determined ((In-Scope Tel. Numbers) + (Out-of-Scope Tel. Numbers))}}$$

For the full sample, this analysis estimated that 38.2 percent of the 75,047 telephone numbers whose residency status was "unknown" at the end of data collection should be considered residential. Using this residency rate, the household interview response rate was calculated as follows:

$$\frac{(\text{Number of Completed Household Interviews}) * 100}{(\text{Number of In-Scope Telephone Numbers}) + (0.382) * (\text{Number of Telephones with Eligibility Unknown})}$$

The numerator includes the 106,598 completed household interviews. The denominator includes all 188,395 in-scope telephone numbers and 38.2 percent of the 75,047 telephone numbers whose eligibility was "unknown" at the end of data collection. Using this formula **the household interview response rate for the 2001 NHTS full sample was 49.1 percent.**

For the national sample, this analysis estimated that 41.7 percent of 14,306 telephone numbers whose residency status was "unknown" at the end of data collection should be considered residential. Despite this higher residency rate, the household interview response rate for the national sample was 58.0 percent, substantially higher than the 49.1 percent rate for the full sample.

#### **I-4. PERSON INTERVIEW CLASSIFICATION**

In this section the final classification result is shown for each household member for the full sample and national sample households in which a household interview was completed. The number of household members enumerated in these

---

<sup>1</sup> Frankel, 1983

completed households was 281,555 in the full sample and 97,314 in the national sample. Table 4-2 displays the final result classification after all call attempts to each household member had been exhausted or the six-day window to complete a person interview had expired whichever date came first.

As shown in Table I-2, person interviews were completed with 58.2 percent of the household members in the 106,598 households in the full sample.

**Table I-2. Classification of Household Members in Households Where a Household Interview was Completed**

Person Interview Classification Result	Full Sample		National Sample	
	Number	Percent	Number	Percent
Completed Person Interviews	163,856	58.2%	61,709	63.4%
Person Interviews Not Completed	117,698	41.8%	35,605	36.6%
Maximum Calls/Six-Day Window Reached	Not Available	Not Available	28,053	78.8%
Refusals	Not Available	Not Available	6,167	17.3%
Language or Communication Barrier	Not Available	Not Available	461	1.3%
Non-working	Not Available	Not Available	435	1.2%
Non-residential	Not Available	Not Available	63	0.2%
Not Available or Sick	Not Available	Not Available	401	1.1%
Other Non-Interview	Not Available	Not Available	25	0.1%
Total Person Interviews Attempted	281,555	100%	97,314	100%

**I-5. PERSON INTERVIEW UNWEIGHTED RESPONSE RATE**

The person interview response rate is calculated by dividing the number of person interviews that were completed by the total number of household members eligible for a person interview. Since all the 97,314 household members (national sample) enumerated in the 36,810 households were eligible for participation in the 2001 NHTS, the national sample person response rate for the survey, 63.4 percent, is

identical to the person interview completion rate reported in Table I-2. Similarly, **the full sample person response rate is 58.2 percent.**

**I-6. OVERALL CASRO RESPONSE RATES**

Unweighted response rates are provided as a basis of comparison to previous NPTS surveys. During the 2001 NHTS, household interviews were completed in 106,598 households (36,810 in the national sample) and person interviews were completed with 163,856 persons (61,709 in the national sample). A sample of 568,796 telephone numbers (152,191 in the national sample) was needed to obtain these completed interviews. Sections I-3 and I-5 presented the household and person interview response rates. The overall CASRO survey response rates are presented in Table I-3. The table shows that this response rate is 28.6 percent for the full sample and 36.8 percent for the national sample.

**Table I-3. Overall CASRO Unweighted Response Rates Using Person Rates for All Households**

	Full Sample		National Sample	
	Rate Calculation	Response Rate	Rate Calculation	Response Rate
Household Interview Response Rate	$106,598 / (188,395 + 188,395 / (188,395 + 305,354) * 75,047)$	49.1%	$36,810 / (57,506 + 57,506 / (57,506 + 80,379) * 14,306)$	58.0%
Person Interview Response Rate	$163,856 / 281,555$	58.2%	$61,709 / 97,314$	63.4%
Overall Survey Response Rate	$49.1 * 58.2$	28.6%	$58.0 * 63.4$	36.8%

## **I-7. USEABLE HOUSEHOLDS**

### **I-7.1. HOUSEHOLD RESULTS: USEABLE VERSUS NON-USEABLE**

The 2001 NHTS defined a "useable" household as one in which person interviews were completed with at least 50 percent of the household's adults. The 2001 NHTS public use dataset contains the information collected from these useable households.

Table I-4 shows the breakdown of the households with completed household interviews by the number of household members in these households that completed person interviews. The table shows that, for the full sample, 69,817 or 65.5 percent of the 106,598 households were considered useable households. In 60,520 (86.7 percent) of these useable households, person interviews were completed with all adult household members. For the national sample, 70.7 percent of the 36,810 households were considered useable households. In 85.2 percent of these useable households, person interviews were completed with all adult household members.

**Table I-4. Classification of Households into Useable Households Based on Person Interview Results**

<b>Breakdown of Households into Useable and Non-Useable</b>	<b>Full Sample</b>		<b>National Sample</b>	
	<b>Number</b>	<b>Percent</b>	<b>Number</b>	<b>Percent</b>
Useable Households - Total	69,817	65.5%	26,038	70.7%
Households with All Adult Household Members Completing a Person Interview	60,520	86.7%	22,178	85.2%
Households with 50 Percent or More but Less Than 100 Percent Adult Person Interviews Completed	9,297	13.3%	3,860	14.8%
Households with Less than 50 Percent of Adult Household Members Completing a Person Interview	36,781	34.5%	10,772	29.3%
Households with at least one Person Interview Completed	2,187	5.9%	957	8.9%
Households with Zero Person Interviews Completed	34,594	94.1%	9,815	91.1%
Total Household Interviews Completed	106,598	100%	36,810	100%

**I-7.2. PERSON RESULTS IN USEABLE HOUSEHOLDS**

Table I-5 shows the person response rate information within 2001 NHTS useable households. Data for each of the 160,758 responding persons for the full sample in useable households is included in the 2001 NHTS public use dataset, and accounts for nearly all of the 163,856 (see Table I-2) person interviews completed during the 2001 NHTS. The person interview response rate was 91.4 percent in useable households (90.6 percent for the national sample). As discussed in Section 2-B.4, proxy interviews were either required or preferred for subjects under age 16.

However, interviews with the subject were preferred for the 47,248 persons age 16 and older in the national sample. For these, 36,208 interviews were completed with the subject, representing 76.6 percent of interviews with persons age 16 and older. These numbers are not available for seven of the add-on areas and therefore provided only for the national sample.

**Table I-5. Person Unweighted Response Rate Within Useable Households**

<b>Breakdown of Person Interviews in Useable Households</b>	<b>Full Sample</b>		<b>National Sample</b>	
	<b>Number</b>	<b>Percent</b>	<b>Number</b>	<b>Percent</b>
Completed Person Interviews - Total	160,758	91.4%	60,282	90.6%
Subject 16 and Older: Person Interview with Subject	Not available	Not available	36,208	60.1%
Subject 16 and Older: Person Interview by Proxy	Not available	Not available	11,040	18.3%
Subject 16 and Older, Total	126,498	78.7%	47,248	78.4%
Subject less than 16: Person Interview with Subject	Not available	Not available	45	0.1%
Subject less than 16: Person Interview by Proxy	Not available	Not available	12,989	21.5%
Subject less than 16, Total	34,260	21.3%	13,034	21.6%
Person Interview Not Completed	15,056	8.6%	6,262	9.4%
Total Household Members in Useable Households	175,814	100%	66,544	100%

**I-8. OVERALL UNWEIGHTED SURVEY RESPONSE RATES FOR USEABLE HOUSEHOLDS**

In this section the overall unweighted response rate for useable households is calculated. Table I-6 shows that this overall response rate is 32.2 percent for the full sample and 41.0 percent for the national sample. Within the 69,817 full sample useable households, 91.4 percent of all household members were interviewed. This produces a

useable household person interview response rate of 29.4 percent. This calculation of the overall response rates mimics the method used during the 1995 NPTS. The method uses person response rates for useable households instead of all households. [Note: The overall unweighted survey response rate for all households, 28.6 percent, is calculated in Section I-6.]

For the national sample, 90.6 percent of all household members in useable households were interviewed. This results in a useable household person interview response rate of 37.1 percent.

**Table I-6. Overall Unweighted Response Rates Using Person Rates for Useable Households**

	Rate Calculation	Individual Rate	Rate Calculation	Composite Rate
<b>Full Sample:</b>				
Estimated In-Scope Telephone Numbers	$188,395 + (188,395 / (188,395 + 305,354) * 75,047) = 217,030$			
Telephone Number Screening Rate	$188,395 / 217,030$	86.8%		86.8%
Household Interview Rate	$106,598 / 188,395$	56.6%	$86.8 * 56.6$	49.1%
<b>Useable Household Rate</b>	<b>69,817 / 106,598</b>	<b>65.5%</b>	<b>65.5 * 49.1</b>	<b>32.2%</b>
Useable Household Person Interview Rate	$160,758 / 175,814$	91.4%	$91.4 * 32.2$	29.4%

Household Interview Rate	$36,810 / 57,506$	64.0%	$90.6 * 64.0$	58.0%
<b>Useable Household Rate</b>	<b>26,038 / 36,810</b>	<b>70.7%</b>	<b>70.7 * 58.0</b>	<b>41.0%</b>
Useable Household Person Interview Rate	$60,282 / 66,544$	90.6%	$90.6 * 41.0$	37.1%

## APPENDIX J

### METHODS TO ESTIMATE ANNUAL MILES DRIVER PER VEHICLE

#### J-1. INTRODUCTION

In the 2001 NHTS, the amount of driving (VMT) driven by an NHTS household vehicle could be estimated in three different ways. First, one can annualize the odometer readings recorded approximately two to three months apart. Second, a designated household member was asked to report the total number of miles driven in each of the household vehicles (hereafter referred to as “self-reported VMT”). Finally, the amount of annual driving can be estimated based on the amount a vehicle is driven during the designated sample day (i.e., the travel day). Ideally, annualizing the odometer readings would probably generate the most reliable VMT estimate compared to estimates based on the other two approaches. Unfortunately, not all vehicles had their odometer readings recorded. Furthermore, of those that had their odometer reading recorded, the quality of some of the odometer readings is less than desirable. As such, ORNL was asked to estimate the number of miles driven by each of the NHTS vehicles based on the best available data. This estimate is hereafter referred to as the *BESTMILE*. *BESTMILE*s are furnished only for automobiles, pickup trucks, vans, sport utility vehicles, and motorcycles. The value of the *BESTMILE* for motorcycles equals the value of the self-reported VMT. There are no *BESTMILE* estimates for other trucks or recreational vehicles (RV). The *BESTMILE* estimates were computed only for vehicles in the National Sample households.

The *BESTMILE* estimates were developed using the National sample of the NHTS data (Version 1, dated January 2003). Since then, some of the data used in the development of the *BESTMILE* estimates were modified during the editing process for the January 2004 version of the NHTS. These modifications affected data on 187 sampled vehicles including data on vehicle type (*VEHTYPE*), self-estimated annual miles driven (*ANNMILES*), household vehicle count (*HHVEHCNT*), and other variables that were used

to estimate the annual miles driven per vehicle. Due to the resource constraints in this study, the *BESTMILE* estimates for these vehicles were not updated to reflect January 2004 data. For these vehicles, *BESTMILE* was set to "Not Ascertained," and the associated *BEST\_FLG* (i.e., How the *BESTMILE* was computed) was set to "No Best\_Estimate, underlying values changed in editing, and all other associated variables were changed accordingly."

## **J-2. QUALITY OF ODOMETER READINGS**

Odometer readings were collected for each household vehicle at two points in time. The first was at or around the time of the person interviews. The second was at least two months later. The dates of each reading were recorded to facilitate the estimation of annual mileage. Of the 31,939 vehicles with two valid recording dates, 3% of them recorded odometer readings less than 2 months apart while less than 1% recorded the readings more than one year apart (Table J-1).

**Table J-1. Lag Time between Two Odometer Readings 2001 NHTS**

Lag Time in Days	No. of NHTS Vehicles with two valid dates	% of NHTS Vehicles
0 - 30	100	0.3%
31 - 60	979	3.1%
61 - 90	5,367	16.8%
91 - 120	12,121	38.0%
121 - 150	1,871	5.9%
151 - 180	2,157	6.8%
181 - 210	2,889	9.1%
211 - 365	6,235	19.5%
> 365	220	0.7%
Total	31,939	100.0%

\* Applies to 31,939 vehicles that have two valid recording dates.

To determine whether odometer reading data are usable for estimating annual mileage, they were checked with respect to:

- (1) the *completeness* of data – Both the beginning and the ending odometer readings and the corresponding recording dates are reported.
- (2) the *reasonableness* of the readings – Example of such reasonableness checks are that the second reading must be greater than the first reading, and the second date chronologically follows the first date.
- (3) the *consistency* to the self-reported VMT – If the odometer readings of a vehicle are not reliable for estimation purposes, its self-reported VMT is used. Therefore, the relationship between the difference between two odometer readings and the self-reported VMT needs to be reasonable and consistent. Arbitrary boundaries were set to determine the “consistency” between the self-reported VMT and the difference between two odometer readings. If the ratio of the odometer-based daily driving to the self-reported daily driving was

greater than 4 or less than 0.25, and the difference between the two VMT estimates is greater than 10,000 miles per year, then the odometer readings were considered *unusable*.

After accounting for the vehicle types that are excluded for the purpose of estimating the *BESTMILE* and the vehicles that failed the data quality checks, 25,292 of the 53,278 vehicles in the national sample had reasonable odometer readings and other key data elements that could be used to estimate *BESTMILE* based on odometer readings (Table J-2).

**Table J-2. 2001 NHTS Sample Vehicles by Data Required to Estimate Odometer-based *BESTMILE***

Data Quality Checks	Number of Sample Vehicles*	%
<b>Total 2001 NHTS Vehicles (National Sample)</b>	<b>53,278</b>	<b>100.0</b>
- Incomplete odometer readings and/or date data	21,357	40.09
- Negative differences between 2 odometer readings	2	0.00
- Differences between 2 odometer readings too large (more than 550 miles per day)	64	0.12
- The second reading chronologically proceeded the first one.	7	0.01
<b>Vehicles with usable odometer reading data (Total vehicles less all of the above)</b>	<b>31,848</b>	<b>59.77</b>
- No primary driver associated with the vehicle	3,492	6.55
- Out-of-scope vehicles (such as "Other truck", RV, motorcycle, "other", "don't know" vehicle types)	943	1.77
- The ratio of odometer-based daily driving to self-reported daily driving is outside the range of 0.25 - 4.0; and the absolute difference between the two driving estimates is greater than 10,000 miles per year	2,121	3.98
<b>Vehicles with their <i>BESTMILE</i> estimated based on odometer readings</b>	<b>25,292</b>	<b>47.47</b>

\* Data quality checks were done **sequentially**. Therefore, the number of vehicles reported is those that have passed all of the preceding data quality check criteria. For example, 64 vehicles that report too large a difference between 2 readings had passed preceding data quality checks on missing readings or dates, and on negative difference between 2 readings.

### J-3. EXTENT OF DATA AVAILABILITY

Given that only 25,292 vehicles could have their *BESTMILE* estimated based on odometer readings, the next question was how to estimate *BESTMILE* for the remaining 25,558 vehicles. Even with usable odometer readings, it was felt that the *BESTMILE* can be more accurately estimated if other driving-related data were taken into account, such as the self-reported VMT and the characteristics of the primary driver.

Therefore, the method to estimate the *BESTMILE* is largely dictated by the extent to which information is available for a vehicle. The method becomes less sophisticated as less data are available for an individual vehicle. The NHTS sample vehicle population was grouped into six categories based on the availability and usefulness of the key data elements that are necessary to estimate the number of miles driven by a vehicle in a year. The key data elements are: (1) usable odometer readings at two time points, (2) the self-reported VMT, (3) the number of miles driven on the travel day, and (4) the characteristics of the vehicle's primary driver. Because characteristics of the primary driver are used in the estimation of *BESTMILE*, the *BESTMILES* are not estimated for vehicles that are regularly driven by more than one person or vehicles where a primary driver was not indicated. The vehicle population was further categorized by the relationship between the number of vehicles and the number of drivers in the household. The rationale for this additional classification is the hypothesis that vehicles in a household where there are more drivers than vehicles are likely to be driven more than those in a household where there are fewer drivers than vehicles, everything else being equal. Table J-3 summarizes the distribution of the NHTS sample vehicles based on the availability of these key data elements. This distribution helps outline how *BESTMILE* is estimated for each subgroup of vehicles (Section 5).

Table J-3. NHTS Vehicles<sup>1</sup> by Data Required for BESTMILE Estimation

	Usable Data to Estimate Odometer-based <i>BESTMILE</i> ?						
	Yes			No			
	Usage self-reported VMT?			Usage self-reported VMT?			
	Yes	No	Yes	No	Yes	No	
	Information on Primary Driver?			Information on Primary Driver?		Information on Primary Driver?	
	Yes			Yes	No	Yes	No
One driver/One vehicle HHs	3,137	129	1,835	8	176	22	
Two drivers/two vehicles HHs	8,729	1,143	5,427	968	946	394	
Other 'Drivers=Vehicles' HHs	1,996	393	1,718	238	469	159	
'Drivers > Vehicles' HHs	1,341	208	1,189	444	230	182	
'Drivers < Vehicles' HHs	7,357	859	6,284	2,492	1,100	1,277	
Subtotal	22,560	2,732	16,453	4,150	2,921	2,034	
<b>Subtotal by Usable Data</b>	<b>25,292</b>			<b>25,558</b>			

<sup>1</sup> There were 53,278 vehicles included in the NHTS national sample. However, 2,428 of these vehicles were out of scope for the *BESTMILE* estimate. The out-of-scope vehicle types include "other trucks," "recreational vehicles," and vehicles with missing vehicle type information.

#### **J-4. ADJUSTING ODOMETER READINGS TO A FIXED TWELVE-MONTH TIME FRAME**

The recordings of odometer readings began on January 1, 2001 and ended on December 30, 2002, spanning a period of twenty-four months. In order to facilitate the estimation of fuel economy (MPG), fuel consumption, and fuel costs (Appendix K), the odometer readings were standardized to a 12-month period, from May 1, 2001 to April 30, 2002. This time frame was selected because it contained the largest proportion of odometer readings compared to all other possible time spans beginning on the first day of a given month. The goal, therefore, was to adjust odometer readings that were recorded outside the designated 12-month period to within the designated 12-month period. This adjustment was not done in the 1995 NPTS.

Aggregate VMTs reported in Federal Highway Administration's (FHWA) *Highway Statistics* were used to account for seasonal and yearly differences in driving (Table J-4). For example, the seasonal difference in driving between June and July of 2001 was that the amount of driving in July was about 2.6% greater than that in June. And, the difference in driving between June and July of 2002 was 3.2%. It was assumed that the seasonal difference and the difference from one year to the next apply to the amount of driving by individual vehicles.

Therefore, if the odometer readings of a vehicle were recorded on July 1 and July 31, **2002** (outside the designated 12-month period), then the adjustment needs to be made as if the readings were recorded on July 1 and 31, **2001** (within the designated period), respectively. Since the dependent variable for estimating the *BESTMILE* was the miles driven per day, the adjustment to this vehicle was

$$\frac{\text{Odometer2} - \text{Odometer1}}{\text{Date2} - \text{Date1}} \times \frac{\text{VMT}_{\text{July2001}}}{\text{VMT}_{\text{July2002}}} \left( = \frac{248.8}{254.2} \right)$$

where Odometer 2 and Date 2 are the reading and the recording date of the second odometer reading while Odometer 1 and Date 1 are the first reading and the recording date. According to Table J-4, driving on July 2001 is 97.8% (=248.8/254.2) of that on July 2002.

**Table J-4. Total Miles Traveled (VMT) in the United States for All Systems (in Billions)**

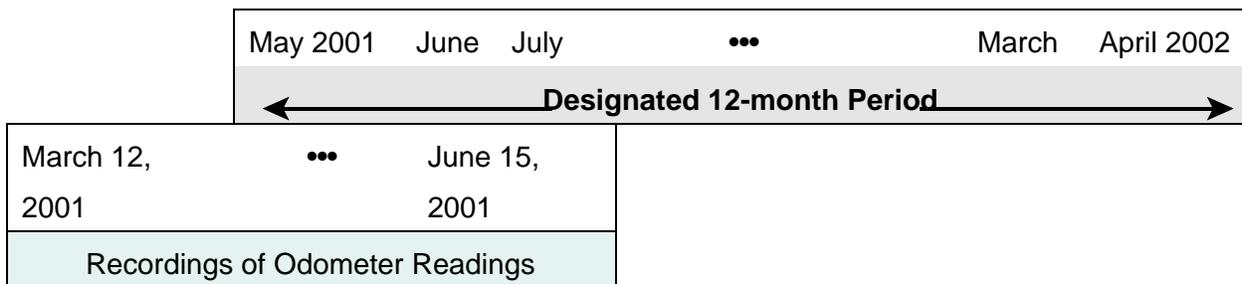

Month	Year 2001	Year 2002
January	209.3	213.8
February	199.9	206.5
March	231.5	234.0
April	231.4	234.8
May	244.3	249.9
June	242.6	246.4
July	248.8	254.2
August	251.7	256.2
September	224.6	230.6
October	240.0	243.2
November	229.5	228.4
December	228.1	231.3

Let's assume that (Odometer 2 - Odometer 1) = 300 miles. Without any adjustments to the designated 12-month period, the number of miles driven per day is 10 miles (=300 miles/30 days). However, if the odometer readings were recorded on July 2001 instead of

July 2002, then the number of miles driven per day for the days on July 2001 would have been 9.8 miles ( $= \frac{300 \text{ miles}}{30 \text{ days}} \times \frac{248.8}{254.2}$ ).

The adjustment procedure is complicated when there were multiple months involved and/or odometer readings were recorded over two years. The adjustment procedure became even more complicated if the recordings of the odometer readings straddled dates *inside* and *outside* the designated time period, such as if the odometer readings were recorded from March 12, 2001 to June 15, 2001 (Figure J-1). Rather than shifting the entire recording period to “inside” the designated time period, the procedure adjusted only the miles driven outside the designated period, and left the miles driven inside the designated period intact. In this example, the task was to adjust the number of miles driven during the period from March 12, **2001** through April 30, **2001**, as if the driving had taken place from March 12, **2002** through April 30, **2002**.

**Figure J-1. Example of Odometer Readings Straddling Dates *Inside* and *Outside* the Designated 12-Month Period**

Rather than adjusting the number of miles driven between the first and the second odometer readings, the adjustment was made to the shares of driving attributable to each of the forty-eight different temporal categories. These forty-eight categories are the unique combinations of 2 years, 12 months, and weekend vs. weekday. A set of forty-eight percentages was created for each NHTS vehicle, each percentage being the proportion of days in a given category over the total number of days between two readings. Each of

these 48 percentages was used as a proxy of the share of driving that was attributable to the days in that year/month/weekday (vs. weekend) category. The sum of these 48 percentages is equal to 1.

The rationale for adjusting the proportion of days in each of the 48 categories, rather than the total miles driven, was the modeling specifications of the *BESTMILE* estimation approaches. First, the dependent variable of the *BESTMILE* estimation approaches was the miles driven per day. Second, terms were included in the models to account for the temporal differences in driving (i.e., the seasonal, the yearly, and weekend/weekend differences in driving). The adjustments to the percentages of days, rather than the total miles driven between two readings, facilitated the modeling process.

Table J-5 illustrates the rationale and steps taken to adjust the odometer readings recorded from March 12 through June 15, 2001. Reading from March 12 through April 30 was outside the designated period while the remaining dates were inside the period. The odometer readings were recorded over a period of 96 days, from March 12 through June 15. Therefore, the contribution of *weekday* driving in March 2001 toward the total driving during the 96-day period was approximated to be 15.6%, while the corresponding *weekend* contribution was 5.2%. May and June percentages were not adjusted because they were within the designated time period. Since *Highway Statistics* does not categorize VMT by weekday vs. weekend, the adjustment factors for weekend-days and weekdays are identical.

Based on *Highway Statistics*, the driving in March 2001 was 98.9% ( $=231.5/234.0$ ) that in March 2002 (Table J-4). To adjust the March 2001 driving as if it took place in March 2002, the share of March 2001 days was adjusted by multiplying it by 0.989. Similarly, the share of April 2001 days was adjusted by multiplying it by 0.986 ( $=231.4/234.8$ ). The percentages were re-calculated after the adjustments [Column (7)].

**Table J-5. Adjustments to Miles Driven during March 12 through June 15, 2001**

Month (1)	(2)	No. of Days (3)	% of Days (4)	Adjustment factor <sup>1</sup> (5)	Adjusted No. of Days (6)	% of Adjusted Days (7)
March	Weekday	15	15.6%	0.989=231.5/234.0	14.8=15×0.989	15.6%
	Weekend	5	5.2%	0.989=231.5/234.0	4.95=5×0.989	5.2%
April	Weekday	21	21.9%	0.986=231.4/234.8	20.7=21×0.986	21.7%
	Weekend	9	9.4%	0.986=231.4/234.8	8.87=9×0.986	9.3%
May	Weekday	23	24.0%	*	23	24.1%
	Weekend	8	8.3%	*	8	8.4%
June	Weekday	11	11.5%	*	11	11.5%
	Weekend	4	4.2%	*	4	4.2%
Total		96	100.0%		95.36	100.0%

<sup>1</sup> Based on the total monthly VMT as reported in the *Highway Statistics*.

\* No adjustments were made because May and June were inside the designated time period.

These 48 percentages were then consolidated into 24 terms for modeling purposes by adding together the proportions of days in the same month (e.g., March) but in different years. For example, if odometer readings were recorded from March 2001 through March 2002. Then, the proportion of weekdays in March 2001 (which was outside the designated period) was adjusted and added to the unadjusted proportion of weekdays in March 2002 (which was inside the designated period). A single term was then created to represent the contribution of *weekday* driving in March 2002. Similarly, a single term was created to represent the contribution of *weekend* driving in March 2002. This consolidation was necessary so that the temporal differences in driving are represented by 23 terms ( $n1 - n23$ ) in the *BESTMILE* estimation approaches (Section 5). Driving attributable to the weekends in December 2001 was the baseline in the estimation models; thus there were only 23 terms.

## J-5. ESTIMATION METHODS

Six different estimation approaches were developed.

**Approach 1.** *For vehicles with usable odometer readings, self-reported VMT, and information on the primary driver.*

There were 22,560 vehicles in this category (Table J-3). This approach assumes that the daily driving of a vehicle, which is calculated based on two odometer readings, is a function of:

- the daily driving based on self-reported VMT,
- the characteristics of the primary driver, and
- other household and geographical attributes.

Since the number of drivers and vehicles in a household affects the amount of driving per vehicle, models were estimated separately for three different types of households: (1) households with one vehicle and one driver, (2) multi-driver households with an equal number of vehicles and drivers, and (3) households with unequal numbers of vehicles and drivers. The models are represented in Equation (1),

$$Y = X\beta + R, \tag{1}$$

where  $Y$  is the vector of observed average daily mileages (based on odometer readings),  $X$  is the vector of independent variables,  $\beta$  is the matrix of model parameter estimates, and  $R$  is the vector of residuals. The vector of independent variables,  $X$ , includes the month-weekend/weekday terms ( $n1 - n23$ ), daily self-reported VMT ( $ANNMILES/365$ ), education level ( $EDUC$ ), age of the respondent ( $R\_AGE$ ), vehicle age class ( $VEHAGEC$ ), vehicle type ( $VEHTYPE$ ), area size ( $MSASIZE$ ), census division ( $CENSUS\_D$ ), life cycle of the

household (*LIF\_CYC*), worker status and gender of the primary driver (*WORKER* and *R\_SEX*, respectively), and size of the household (*HHSIZE*). The model for the case with an unequal number of drivers and vehicles also used a categorical variable for the driver to vehicle ratio (*DRVEH*).

The seasonally-adjusted daily driving estimates are computed using the residual for each vehicle, plus the predicted value of the model, and adjusted to values of *n1* through *n23* to reflect the twelve months from May 2001 to April 2002. The residual was retained since the goal was to create seasonally-adjusted annualized estimates, as opposed to predictions completely free from random noise. The best estimate on the annual driving per vehicle was computed by multiplying this seasonally-adjusted daily driving by 365.

**Approach 2.** *For vehicles with self-reported VMT, and information on the primary driver, but without usable odometer readings.*

Equation (1) was used to estimate their annual driving for the 16,453 vehicles with usable self-reported VMT and information on the primary driver, but without usable odometer readings. However, since information from these vehicles was not used to estimate the model, there were no residuals. As such, the estimates for this group of vehicles have a significantly small random noise term than the 22,560 vehicles used to estimate the model. To overcome this problem, residuals from the original 22,560 vehicles were randomly assigned, *without* replacement, to the 16,453 vehicles.

If an estimated  $\hat{y}$  is less than 0 or greater than 200,000 miles per year, then a second randomly assigned residual was used. This process was repeated one more time if the estimated  $\hat{y}$  was still outside the range of 0 and 200,000 miles per year. However, after this point, if  $\hat{y}$  was still outside the range, then *BESTMILE* was set at 0 or 200,000 miles.

**Approach 3.** For vehicles with self-reported VMT, but without odometer readings and usable information on the primary driver.

There were 4,150 vehicles in this category (Table J-3). Although odometer readings were missing for these vehicles, the strong relationship between self-reported VMT and odometer readings suggested the following estimation approach:

$$BESTMILE_i = \hat{\alpha} + \hat{\beta} \times ANNMILES_i + R_i \quad (2)$$

where  $\hat{\alpha}$  and  $\hat{\beta}$  are from Equation (1). The pseudo-residuals were assigned similar to Approach 2, *without* replacement.

**Approach 4.** For vehicles with usable odometer readings and information on the primary driver, but without self-reported VMT.

There were 2,732 vehicles in this category (Table J-3). The estimation model was similar to Equation (1), except for the exclusion of the self-reported VMT. Furthermore, the small sample sizes precluded separate estimation models from being developed for households with different ratios of vehicles to drivers. Instead, the *DRVEH* variable was included in the model. The *BESTMILE* estimate for this group of vehicles was  $\hat{y}$  multiplied by 365.

**Approach 5.** For vehicles with usable information on the primary driver, but without odometer readings and self-reported VMT.

There were 2,921 vehicles in this group (Table J-3). The estimation model was that developed based on data from the vehicles described in Approach 4.  $\hat{y}'_s$  for this group of vehicles had the issue of a small random noise term, similar to the vehicles included in Approach 2. Therefore, this group of 2,921 vehicles required the assignment of pseudo-residuals. However, because the estimation model was developed based on information from 2,732 vehicles and there were 2,921 vehicles requiring pseudo-residuals, the

residuals were randomly assigned *with* replacement.

**Approach 6.** For vehicles with no driving information except that collected on the travel day.

There were 2,034 vehicles that had no usable odometer readings, no self-reported VMT, and no information on the primary driver. Of these, driving was recorded for only 958 vehicles during the travel day while the remaining 1,076 vehicles were assumed not to be used on that day. For the 958 vehicles, the total number of miles driven on the travel day was annualized by multiplying the number of miles driven in the travel day by 365. Since a vehicle was unlikely to be driven every day of the year, the annualized miles were adjusted by the probability that a vehicle was driven on a typical weekday, or weekend, depending on whether the travel day was a weekday or a weekend. The equation below indicates how the *BESTMILE* was estimated for vehicles in which their travel day fell on a weekday:

$$\begin{aligned} \text{BESTMILE} &= 365 \times (\text{Miles driven on the travel day}) && (3) \\ &\times \text{Prob}(\text{vehicle was driven on a weekday}) \\ &\times \text{Mean}(\text{miles driven on a weekday}) \end{aligned}$$

where *Prob*(vehicle was driven on a weekday) is the weighted proportion of vehicles driven on a *weekday* travel day to all vehicles; and *Mean*(daily miles driven on a weekday) is the weighted average of miles driven for vehicles driven on a *weekday* travel day. A similar approach was used for vehicles that were driven on a travel day that was a weekend.

*BESTMILES* was missing for vehicles that were not used on the designated travel day and that had no information on their primary drivers or driving patterns (e.g., odometer readings, self-reported VMT). There were 2,080 such vehicles.

## J-6. SCREENING OF BESTMILE ESTIMATES

Once the *BESTMILE* estimates were derived using one of the aforementioned approaches, they were evaluated for *reasonableness*. With two odometer readings recorded less than one year apart, if the value of the *BESTMILE* is less than the difference between two odometer readings, then the *BESTMILE* is deemed unreasonable. Furthermore, since the estimation approaches do not constrain the values, some *BESTMILE* estimates could be negative. As in 1995, adjustments were made to the estimated annual mileage if it had a negative value, or if it was less than the difference between the two odometer readings. Similar to the approach used in the 1995 NPTS, unreasonable *BESTMILE* estimates were adjusted in one of two ways. First, if odometer readings were present and valid, then the *BESTMILE* is

$$\frac{(Odometer2 - Odometer1)}{(Date2 - Date1)} \times 365 \quad (4)$$

where *Odometer2* and *Date2* are the reading and the recording date of the second odometer reading while *Odometer1* and *Date1* are for the first reading. The annual mileage calculated using Equation (4) is hereafter referred to as the *Crude Estimate*. However, If no odometer readings were present or valid, then the *BESTMILE* was set at 0.

Finally, in keeping with the cap of 200,000 miles on the self-estimated VMT, if the value of *BESTMILE* exceeds 200,000 miles per year, then the estimate was set at 200,000 miles per year. Table J-6 summarizes various adjustments to the *BESTMILE* estimates.

**Table J-6. Adjustments to *BESTMILES***

Adjustment Code	Frequency	Percent	Criteria	Adjustment
	52,361	98.28%	No adjustment	None
1	798	1.50%	No. of days between two odometer readings is less than 365 and the <i>BESTMILE</i> is less than the difference between two readings	<i>BESTMILE</i> = difference between two readings
2	5	.01%	No. of days between two odometer readings is greater than 365 and the <i>BESTMILE</i> is greater than the difference between two readings	<i>BESTMILE</i> = difference between two readings
3	8	0.02%	No. of days between two odometer readings is greater than 365 and the value of <i>BESTMILE</i> is negative	<i>BESTMILE</i> = <i>Crude Estimate</i>
4	3	0.01%	<i>BESTMILE</i> > 200,000 miles	<i>BESTMILE</i> = 200,000 miles
6	103	0.19%	No usable odometer readings and <i>BESTMILE</i> is negative	<i>BESTMILE</i> = 0
<b>Total</b>	<b>53,278</b>	<b>100.00%</b>		

Consistently to the data quality checks used in the 1995 NPTS, each *BESTMILE* estimate was compared to its *Crude Estimate* (Equation (4)) and the corresponding self-reported VMT. Outlier codes were then assigned on the basis of these comparisons and the subjectively determined thresholds (Table J-7). Because the self-reported VMTs were considered less reliable than the *Crude Estimates*, the thresholds are tighter for the *Crude-vs-BESTMILE* comparisons. Codes based on comparisons of the *BESTMILE* estimate and the *Crude Estimate* were only assigned if the difference exceeded 5,000 miles. Codes based on comparisons of the *BESTMILE* estimate and the self-reported estimate were only assigned if the difference exceeded 10,000 miles. The outlier codes were recorded as numeric codes (*BEST-OUT*) as indicated in Table J-7.

**Table J-7. Outline Codes of *BESTMILES***

<i>BEST_OUT</i>	Frequency	Percent	Criteria
No code	52,155	97.89%	
1	10	0.02%	$BESTMILE < \frac{CrudeEstimate}{2}$ and $ BESTMILE - CrudeEstimate  > 5,000miles$
2	173	0.32%	$BESTMILE < \frac{Self - reportedVMT}{4}$ and $ BESTMILE - Self - reportedVMT  > 10,000miles$
4	9	0.02%	$BESTMILE > CrudeEstimate \times 2$ and $ BESTMILE - CrudeEstimate  > 5,000miles$
5	931	1.75%	$BESTMILE > Self - reportedVMT \times 4$ and $ BESTMILE - Self - reportedVMT  > 10,000miles$
Total	53,278	100.00%	

# APPENDIX K

## ESTIMATION METHODOLOGIES FOR FUEL ECONOMY AND FUEL COST

### Introduction and Overview

The methodology EIA used to estimate the vehicle fuel economy (given in terms of miles per gasoline equivalent gallon (MPG)), vehicle fuel consumption, and vehicle fuel expenditures relied on data from the U.S. Federal Highway Administration (FHWA) 2001 National Household Travel Survey (NHTS); the U.S. Energy Information Administration (EIA) 1985, 1988, and 1991 Residential Transportation Energy Consumption Survey (RTECS); the U.S. Environmental Protection Agency (EPA) fuel economy test results; and the EIA's retail pump price series<sup>1</sup> for 2001 and 2002.

The following sections of this appendix describe the estimation procedures used for calculating the MPG, the vehicle fuel consumption, the vehicle fuel prices, and the vehicle fuel expenditures. Also described in this appendix are the sources of data that were used in the estimation procedures.

The following terms are used throughout this appendix:

<b>Term</b>	<b>Definition</b>
EPA Composite MPG	The EPA dynamometer test procedure, performed on pre-production prototype vehicles, yields separate test values for EPA city and highway MPG. These city and highway MPG are often combined to form the "composite" MPG.
On-Road MPG	A Composite MPG that was adjusted to account for the shortfall between the test value and the fuel economy actually obtained on the road. The adjustment did not take into account the driving patterns of individual drivers and seasonal differences.

---

<sup>1</sup> Energy Information Administration. Forms EIA-782A, "Refiners'/Gas Plant Operators' Monthly Petroleum Product Sales report," and EIA-782B, "Resellers'/Retailers' Monthly Petroleum Product Sales Report." Form EIA-888, "On-Highway Diesel Fuel Price Survey." Form EIA-895, "Monthly Quantity and Value of Natural Gas Report." Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions."

<b>Term</b>	<b>Definition</b>
In-Use MPG	MPG that were adjusted for seasonal differences and annual miles driven. Vehicles that are driven relatively few miles during the year are assumed to be driven mostly on short trips that involve frequent stops. Vehicles that are driven relatively many miles are assumed to be driven mostly on long trips where few stops are needed.
MPG Shortfall	A measure of the difference between actual on-road MPG and the EPA laboratory test MPG, expressed as the ratio of test MPG to on-road MPG.

The use of EPA test value data from NHTSA is restricted to vehicles that are used to derive Corporate Average Fuel Economy under Title V of the Motor Vehicle Information and Cost Savings Act (15 U.S.C. 1901, et seq.) with subsequent amendments and Subtitle VI (49 U.S.C. 329). Corporate Average Fuel Economy (CAFE) is the sales-weighted average fuel economy, expressed in miles per gallon, of a manufacturer's fleet of passenger cars or light trucks with a gross vehicle weight rating (GVWR) of 8,500 lbs. or less, manufactured for sale in the United States, for any given model year.<sup>2</sup> Fuel economy is defined as the average mileage traveled by a vehicle per gallon of gasoline (or equivalent amount of other fuel) consumed as measured in accordance with the testing and evaluation protocol set forth by Environmental Protection Agency (EPA).

Manufacturers also perform their own fuel economy tests of new vehicle models and submit the results to EPA. EPA is responsible for conducting its own tests or verifying the manufacturers' dynamometer tests. EPA also is responsible for compiling the production data from manufacturers' reports and furnishing CAFE results to NHTSA.

Fuel economy test data from the manufacturers and EPA serves as the starting point for both CAFE values and real-world fuel economy projections. For CAFE, the test data are adjusted upward to account for any credits for dual-fuel alternative fuel vehicles (AFV) and dedicated AFV, and for passenger cars only, is also adjusted upward for credits available to manufacturers to account for test procedure changes since the CAFE program was established. For NHTS, such credits and their associated upward adjustments were removed.

---

<sup>2</sup> These vehicles are consistent with 2001 NHTS sample vehicles having a vehicle type of 01 (Automobile), 02 (Van), 03 (Sport Utility Vehicle), or 04 (Pickup Truck). EPA does not provide test data for vehicles such as the Ford Excursion, Hummer H1 and Hummer H2 because they have a GVWR greater than 8,500 lbs.

The estimation of these statistics (vehicle fuel economy, vehicle fuel consumption, and fuel expenditures) occurred in several steps (see Figure 1).

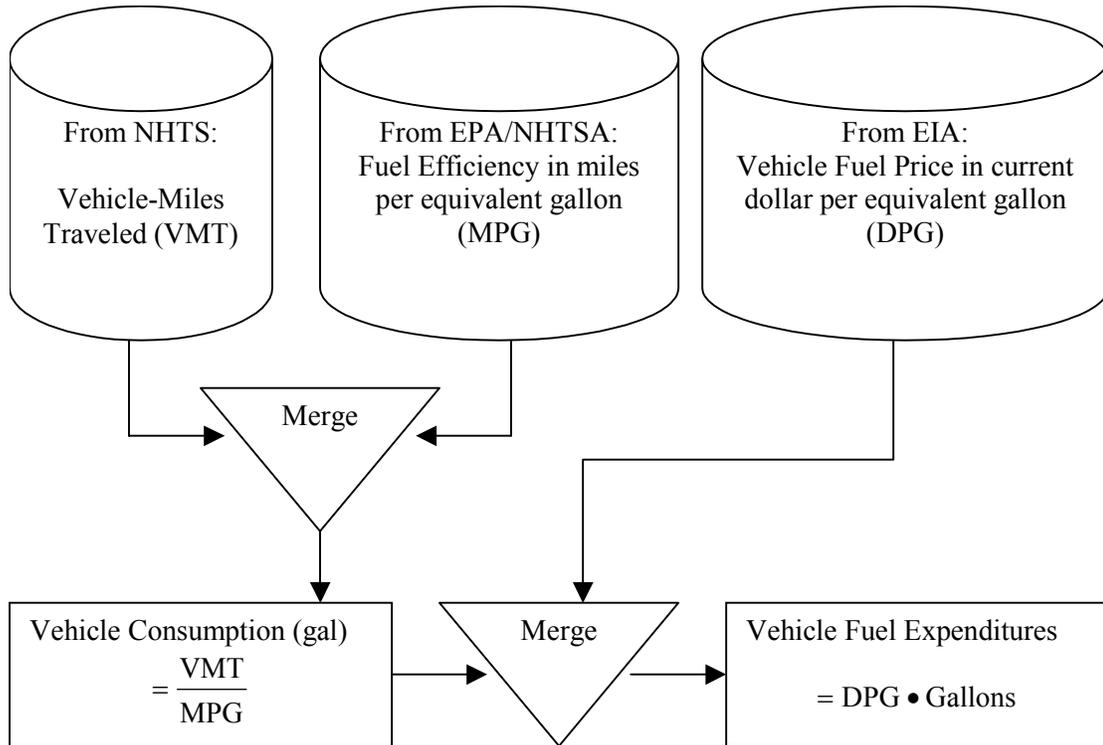

- 1) The basic input for the process was the VMT estimate for each NHTS vehicle in the national sample (see Appendix J).
- 2) Second, the annual on-road fuel economy, given in terms of MPG, was estimated using the characteristics of the vehicle from the household interview<sup>3</sup>, EPA fuel economy test results, and the fixed 12-month period between May 1, 2001 and April 30, 2002 that the vehicle was in use. The Composite MPG (i.e., an unadjusted 45 percent highway and 55 percent city weighted estimate) values were adjusted to account for the difference between EPA test values and on-road values.
- 3) Third, estimated vehicle fuel consumption was derived by dividing the VMT by the estimated MPG.
- 4) Finally, multiplying the vehicle fuel consumption by the fuel price derived the estimated vehicle fuel expenditures.

The NHTS did not collect vehicle fuel prices via fuel purchase diaries. Instead, each NHTS vehicle was assigned a price based on its imputed fuel type. All fuel price information was obtained from the EIAs fuel price series, with the notable exception of fuel tax rates for gasoline. Information on gas tax rates were obtained from FHWA's *Highway Statistic* reports.

---

<sup>3</sup> Vehicle Identification Numbers (VIN) were not collected in the 2001 NHTS. Instead, vehicles were classified using make (MAKECODE), model (MODLCODE), model year (VEHYEAR), and 8 categories of vehicle type (VEHTYPE), as given in *Section B: Vehicle Data* of the 2001 NHTS questionnaire.

**Figure 1. Estimation Schematic**

Note: NHTS – National Household Travel Survey, EPA – Environmental Protection Agency, EIA – Energy Information Administration, and NHTSA – National Highway Transportation Safety Administration.

### Vehicle Fuel Economy

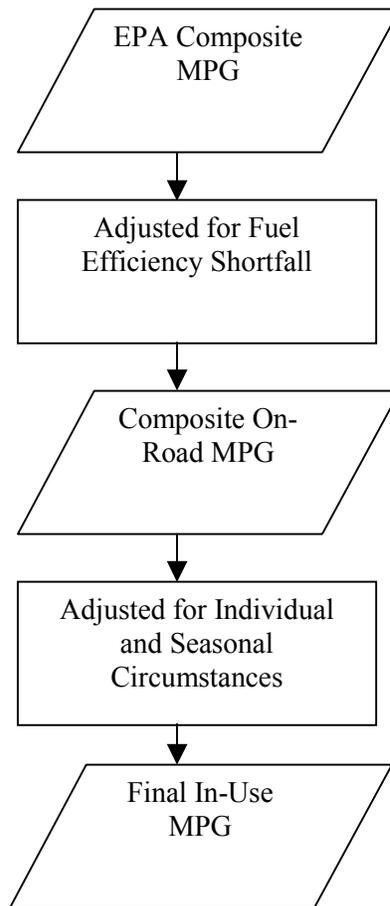

Fuel economy (MPG) was estimated for each NHTS sample vehicle in order to estimate each vehicle's fuel consumption for the survey year. Fuel consumption was estimated by dividing the VMT for time of possession (a fixed 12-month period starting on May 1, 2001 and ending April 30, 2002<sup>4</sup>) by the MPG. MPG values were estimated using EPA laboratory test MPG that were adjusted to account for differences between actual on-road MPG and the EPA test MPG. This difference is known as MPG "shortfall". The adequacy of current shortfall adjustment methods is sufficient for late 1980 through early 1993's motor vehicle model years also (RTECS Technical Note 5).<sup>5</sup> For the 2001 NHTS, the

<sup>4</sup> The 2001 NHTS was conducted over the 14-month period from March 2001 to May 2002. For estimating annual VMT a fixed twelve-month period was calculated.

<sup>5</sup> Harrison, I.M. "VMT 1991 Patterns," Residential Transportation Energy Consumption Survey Technical Note 5, unpublished document. (Washington, DC).

adequacy of shortfall adjustments has been extended for 1994 through 2002's motor vehicle model years. The process employs a sequential adjustment procedure where the EPA Composite MPG was adjusted first to an on-road MPG, and then to an in-use MPG. (see Figure 2)

**Figure 2. Miles per Gasoline Equivalent Gallon Adjustment Procedures**

EPA test MPG was assigned by linking the NHTS vehicle file to the NHTSA Corporate Average Fuel Economy files. Each record of the NHTSA files contained an EPA Composite MPG (i.e., an unadjusted 45 percent highway and 55 percent city weighted estimate) for each unique combination of vehicle attributes within a given manufacture, model/carline, type and model year. The NHTS vehicles were matched based on the make, model, vehicle type, and model year characteristics collected in the NHTS interview.

Although merging (or statistical linking) the NHTS vehicles to the NHTSA Corporate Average Fuel Economy files were restricted to those four attributes, the NHSTA file actually includes a wealth of detail. Vehicle attributes included (1) number of cylinders, (2) cubic inches of engine displacement (CID), (3) type of transmission (manual or automatic), and (4) fuel metering (gasoline, diesel, electric, natural gas, dual-, or flexible- fuel vehicle). However, NHTSA file

records did not include whether the vehicle's emissions control package met Federal or California standards. Each record of the NHTSA files also contained the number of vehicles sold, in thousands of vehicles, for each unique combination of attributes, which helped when imputing of some vehicle attributes was required.

Hence, in addition to assigning a Composite MPG, the NHTSA files were used to impute “missing” vehicle attributes: fuel metering and engine type for purposes of assigning an appropriate fuel price. Based on the nonmissing vehicle attributes obtained from the NHTS questionnaire, several records from the NHTSA files were usually found to be potential “matches” to a given sample vehicle. This is referred to as a 1-to-many record linkage. A matching record was chosen from among the several applicable ones, with probability proportional to sales, using the sales figures on the NHTSA files. Once chosen, a record provided (1) EPA Composite MPG, (2) fuel metering, and (3) engine type. Although more attributes were available for selection, EIA limited its matched attributes to those required to assign an appropriate fuel price to a sample vehicle.

### **EPA Composite MPG**

Beginning in the early 1970's, EPA measured fuel economy from tests that were conducted on a dynamometer to simulate actual driving conditions. By 1975, EPA had incorporated separate “city” and “highway” driving cycles into the test. The city and highway MPG were combined to form a “composite” MPG that was then weighted according to sales of the production vehicles in order to assess compliance with Corporate Average Fuel Economy (CAFE) standards. The EPA Composite MPG is based on the assumption of a "typical" vehicle-use pattern of 55 percent city driving and 45 percent highway driving, and has become a convenient single fuel economy measure for analytical and regulatory purposes.

The EPA Composite MPG<sup>6</sup> is defined as:

$$\text{MPG}_{(\text{EPA } 55/45)} = \frac{1}{0.55 \cdot \frac{1}{\text{MPG}_{(\text{EPA city})}} + 0.45 \cdot \frac{1}{\text{MPG}_{(\text{EPA hwy})}}} \quad (1)$$

where:

---

<sup>6</sup> Specifically, the following formulas, as stated in Part 600, Subpart F, §600.207-86, §600.208-77, §600.209-85, §600.510-86 of the 7-1-1994 edition of the 40 CFR, are identified for these calculations.

$MPG_{(EPA\ 55/45)}$  denotes the composite MPG;  $MPG_{(EPA\ city)}$  denotes the fuel economy when vehicle use pattern is city driving only; and,  $MPG_{(EPA\ hwy)}$  denotes the fuel economy when vehicle use pattern is highway driving only.

Because separate city and highway fuel economy estimates were not available on the NHTSA files, a single “shortfall” adjustment factor was derived, as described in the following sections.

## Fuel Economy Shortfall

Fuel economy shortfall occurs when the fuel economy that is actually obtained while using the vehicle is lower than the EPA test results. Reasons for this shortfall are (1) a result of the differences between EPA test vehicles and the vehicles actually in use and (2) the differences between EPA procedures for simulated driving conditions and actual driving conditions. For example, EPA test vehicles are prototypes that do not contain the wide variety of power-consuming accessories often found on vehicles sold to consumers. The test procedures also do not simulate the actual driving conditions that affect fuel economy such as speed and acceleration of individual drivers, road conditions, weather, and traffic. In the 2001 NHTS, adjustments for this fuel economy shortfall were made to the composite MPG ( $MPG_{(EPA\ 55/45)}$ ) that were assigned to the sample vehicles.

Fuel economy shortfall was expressed in terms of the "Gallons per Mile Ratio" or GPMR:

$$GPMR_i = \frac{MPG_{i(EPA55/45)}}{MPG_i} \quad (2)$$

where:

$GPMR_i$  denotes Gallons per Mile Ratio for the  $i^{th}$  vehicle;  $MPG_i$  denotes the on-road MPG or in-use MPG for the  $i^{th}$  vehicle, depending on the analysis; and,  $MPG_{i(EPA\ 55/45)}$  denotes the EPA Composite MPG applicable to the  $i^{th}$  vehicle.

If  $GPMR_i = 1$  then there is no perceived shortfall. If  $GPMR_i > 1$  then there is a shortfall for vehicle  $i$ . That is, the on-road or in-use fuel economy is less than the fuel economy indicated by the EPA Composite MPG. Note that  $GPMR_i$  can represent shortfall with respect to either the on-road or in-use  $MPG_i$ , depending on the analysis being performed.  $GPMR_i$  is commonly chosen as a measure of shortfall as opposed to  $MPG_i$  for the following reasons:

- A shortfall adjustment is most often thought of as a correction factor, or multiplicative constant, rather than as an additive correction.  $GPMR_i$  satisfies this convention.
- Shortfall is usually dependent on a vehicle's

fuel economy level. That is, shortfall is usually higher at high levels of  $MPG_{(EPA\ 55/45)}$  than at low levels of  $MPG_{(EPA\ 55/45)}$ . Therefore, it is more informative to express the amount of shortfall relative to  $MPG_{(EPA\ 55/45)}$  rather than as an absolute quantity.

- $GPMR_i$  is a linear function of  $MPG_{(EPA\ 55/45)}$  and can be modeled using ordinary least squares linear regression.
- $GPMR_i$  is a transformation that stabilizes error variances for the purposes of least squares linear regression.

## The On-Road MPG

On-road MPG is a composite MPG that was adjusted to account for the shortfall between the EPA fuel economy and the actual fuel economy obtained on the road.

The EPA developed two general procedures for adjusting  $MPG_{(EPA\ 55/45)}$  to an on-road value. One procedure bases the size of the adjustment on specific technology features of the vehicle. The other procedure uses just two MPG discount factors, one to adjust the EPA highway estimate, the other to adjust the city estimate. These two factors are used for all vehicles, regardless of vehicle type technology.

Either of these procedures could have been used to approximate an adjusted  $MPG_{(EPA\ 55/45)}$  to an on-road MPG value for use in the 2001 NHTS. Since both procedures were unbiased for trucks, the choice as to which to employ in the 2001 NHTS was based on their performance with cars. According to the 1994 RTECS, the adjustment based on discount factors seemed to be less biased than the Technology-Specific Adjustment when applied to cars. Therefore, a single discount adjustment factor was used.

## Shortfall Adjustment Based on Discount Factors

EPA's discount factors have widespread appeal because of their simplicity (Hellman and Murrell, 1985<sup>7</sup>; Hellman and Murrell, 1984<sup>8</sup>). The factors are 10 percent for city MPG and 22 percent for highway MPG. That is, for any vehicle  $i$ ,

<sup>8</sup> Hellman, K.H., and Murrell, J.D. 1984. "Development of Adjustment Factors for the EPA City and Highway MPG Values." Society of Automotive Engineers Technical Paper Series, SAE Paper No. 840496, Warrendale, PA.

$$\begin{aligned} \text{MPG}_{i(\text{on - road, EPA city})} &= 0.90 \bullet \text{MPG}_{i(\text{epa city})} \\ \text{MPG}_{i(\text{on - road, EPA hwy})} &= 0.78 \bullet \text{MPG}_{i(\text{EPA hwy})} \end{aligned} \tag{3}$$

These discount factors are the ones used to produce the "sticker" MPG figures seen on vehicles on dealer lots, and are used to produce the DOE/EPA Gas Mileage Guide.

Fuel economy shortfall is affected by the vehicle use pattern: frequent starts and short trip lengths characterize city-driving pattern, while highway-driving pattern is characterized by infrequent starts and long trips. AMPD (Average Miles Driven per Day) is a good surrogate variable for representing these different driving patterns.

The city-driving pattern was characterized by AMPD from 5 to 22 miles per day, while the highway-driving pattern was characterized by AMPD's from 15 to 105 miles per day (Hellman and Murrell, 1984). City fraction and AMPD were used to split the data into two sets, one for development of the city discount factor, the other for development of the highway factor. The "city" and "highway" data sets were each stratified by vehicle technology classes. Linear regression was performed within each stratum. GPMR was regressed on city fraction, AMPD,  $\text{MPG}_{(\text{EPA } 55/45)}$ , odometer reading, and average temperature. The fitted models were then weighted and combined across vehicle technology strata, to produce a single "city" shortfall model and a single "highway" shortfall model. The weights were used to increase the influence of those models that represented technology mixes expected to become more prominent in the future (e.g., front-wheel drive and fuel-injected vehicles). The discount factors were derived from the two.

### The In-Use MPG

The "In-use MPG" rates are adjusted for individual driving circumstances, such as:

- Urban versus rural driving pattern. That is, frequent starts and short trips as opposed to infrequent starts and longer trips. As mentioned in the previous section, a useful single variable for representing this effect is AMPD. High AMPD's usually represent mileage accumulated on the highway.
- Traffic congestion, which increases with population density.
- Seasonal temperature variations, especially for gasoline-carbureted vehicles.
- Humidity, which together with temperature affects air-conditioner use.

- Differences among geographic areas of the country.
- Altitude.
- Wind.
- Road gradient and road surface conditions.

The on-road adjustments to  $MPG_{(EPA\ 55/45)}$  discussed in the previous sections were “general” in that they did not take into account any effects on fuel economy that are due to the driver’s individual circumstances.

However, this appendix does address some of the individual vehicle influences. In general, the first four items are considered the most significant in-use influences (Crawford, 1983).<sup>9</sup> In the cited study, shortfall variations as high as 25 percent or more occurred over the range of typical AMPD. Shortfall was 16 percent higher in urban areas than in completely uncongested areas, and was 12 percent higher in suburban areas. Shortfall varied seasonally (i.e., monthly) by 7 percent in the South and by 13 percent in the North. To define the North and South geographic areas the continental United States were divided into 97 two-digit ZIP Code regions. These regions were grouped to form two aggregate regions (“North” and “South”) according to average winter and summer temperatures, and seasonal shortfall trends.

Regression models were developed (Crawford, 1983) for use in adjusting  $GPMR_{i(on-road)}$  to an in-use shortfall employing measurements of several in-use effects as the independent variables.

One regression model from the Crawford reference that is appropriate for use in NHTS is as follows:

$$\begin{aligned} \delta_{ij} = & 3.296 \cdot \left[ \left( \frac{1}{AMPD_{ij}} \right) - \left( \frac{1}{35.6} \right) \right] + \\ & NORTH \cdot \left[ 0.050 \cdot \sin\left(\frac{j\pi}{6}\right) + 0.075 \cdot \cos\left(\frac{j\pi}{6}\right) \right] + \\ & SOUTH \cdot \left[ 0.030 \cdot \sin\left(\frac{j\pi}{6}\right) + 0.031 \cdot \cos\left(\frac{j\pi}{6}\right) \right] \end{aligned} \quad (7)$$

where  $AMPD_{ij}$  = Average Miles per Day for vehicle  $i$  and month  $j$ , typically 35.6 (i.e., 13,000 miles per year);  $NORTH = 1$  if the household is in the North, otherwise  $NORTH = 0$  if the household is not in the North; and,  $SOUTH = 1$  if the

---

<sup>9</sup> Crawford, R. 1983. "Seasonal and Regional MPG as Influenced by Environmental Conditions and Travel Patterns." Research performed under contract for DOE. Energy and Environmental Analysis, Inc., Arlington, VA.

household is in the South, otherwise SOUTH = 0 if the household is not in the South.

This regression model was chosen because the independent variables that are important in explaining shortfall were readily available from the 2001 NHTS data, using BESTMILE and the distribution of average monthly vehicle miles travel fractions found in Table 2. The model had two components. One component involved  $AMPD_{ij}$  and represented the influence of individual driving patterns for a given vehicle and month. The other component represented the change in shortfall that occurred throughout the seasons, due to the annual temperature cycle.

Once a  $GPMR_{ij(in-use)}$  was estimated it was used to estimate the final in-use fuel economy for vehicle  $i$  and month  $j$  as follows:

$$MPG_{ij(in-use)} = \frac{MPG_{i(EPA\ 55/45)}}{GPMR_{ij(in-use)}} \quad (8)$$

### **Annual Vehicle Fuel Consumption**

In the 2001 NHTS, annual fuel consumption was calculated by dividing the annual VMT by the annual MPG. The derivation of the “annualized” VMT is given in ORNL Appendix.

The  $MPG_{ij(in-use)}$  shown in the above section about fuel economy estimation procedures were final estimates of monthly in-use fuel economies for vehicle  $i$ , and could have been used for estimating monthly fuel consumptions and expenditures, if monthly VMT were known. Unfortunately, NHTS only collected data to annualize VMT. Nevertheless, the 2001 NHTS still made use of the  $MPG_{ij(in-use)}$  by disaggregating the annual VMT of sample vehicles into monthly VMT, using monthly VMT driving fractions from the standard distribution in Table 2.

**Table 2. Distribution of Average Monthly Vehicle-Miles Traveled Fractions**

Month <sub>j</sub>	Average VMT per Vehicle	F <sub>j</sub>
January	688	0.0728
February	697	0.0738
March	771	0.0816
April	783	0.0829
May	832	0.0880
June	847	0.0896
July	868	0.0919
August	872	0.0923
September	800	0.0847
October	802	0.0849
November	756	0.0800
December	734	0.0777
Total	9,450	1.0000

Source: 1984 Petroleum Marketing Index (PMI) Survey, NPD Research Inc. The survey is a demographically and geographically balanced-quota sample of 4,100 households. Respondents maintained fuel purchase diaries for an average of 10 months. As part of the survey, information was collected on the characteristics of trips taken in vehicles during a designated day. Trip lengths were recorded as respondent perception rather than from odometer readings. The distribution of monthly mileage fractions has been obtained from this survey.

The annual consumption for vehicle *i* can be thought of as the sum of the individual monthly consumptions:

$$C_i = \sum_{j=1}^{12} c_{ij} \quad (9)$$

where  $C_i$  denotes annual consumption of vehicle fuel for the *i*th vehicle, in gasoline equivalent gallons and  $c_{ij}$  denotes consumption of vehicle fuel for the *i*<sup>th</sup> vehicle during the *j*<sup>th</sup> month.

Consumption is calculated over 12 months, based on the assumption that the sample vehicle is assumed to exist for a complete 12-month duration in a sample household. Consumption for each month may be expressed in terms of monthly VMT and monthly in-use fuel economy:

$$c_{ij} = \frac{m_{ij}}{\text{mpg}_{ij}}, \forall j = 1, 2, \dots, 12 \quad (10)$$

where  $m_{ij}$  denotes VMT for the  $i^{\text{th}}$  vehicle during the  $j^{\text{th}}$  month and  $\text{mpg}_{ij}$  denotes fuel economy in miles per gasoline equivalent gallon for the  $i^{\text{th}}$  vehicle during the  $j^{\text{th}}$  month. Now, the equation can be rewritten as:

$$C_i = \sum_{j=1}^{12} \frac{m_{ij}}{\text{mpg}_{ij}} \quad (11)$$

ORNL provided the annualized VMT estimate for NHTS that was used to calculate monthly VMT values. Given that value, a monthly VMT was derived for each annualized vehicle VMT as:

$$m_{ij} = M_i \cdot f_{ij} \quad (12)$$

where  $M_i$  denotes for the  $i^{\text{th}}$  vehicle, calculated using odometer readings and procedures discussed in Appendix J and  $f_{ij}$  denotes the average fraction of “annual” VMT that was driven during the  $j^{\text{th}}$  month, estimate for the  $i^{\text{th}}$  vehicle. For all sample vehicles,  $f_{ij}$  was approximated with the average fractions,  $F_j$ , found in Table 2.

Substituting  $\text{mpg}_{ij} = \text{MPG}_{ij(\text{in-use})}$  and  $m_{ij}$  from Equation 12 into Equation 11 yields the following estimate of annual consumption for the  $i^{\text{th}}$  vehicle:

$$C_i = \sum_{j=1}^{12} \frac{M_i \cdot f_{ij}}{\text{MPG}_{ij(\text{in-use})}} \quad (13)$$

Since NHTS assumes that each sample vehicle exists in the sample household for an entire year, no alternative estimators for acquired or disposed vehicles were created.

To simplify calculations, a single “annualized” fuel economy that is analogous to the “annualized”  $\text{MPG}_i$  was estimated as:

$$\text{MPG}_{i(\text{annualized})} = \frac{\text{MPG}_{i(\text{EPA } 55/45)}}{\sum_{j=1}^{12} f_{ij} \cdot \text{GPMR}_{ij(\text{in-use})}} \quad (14)$$

Thus, annual consumption equals:

$$C_i = \frac{M_i}{\text{MPG}_{i(\text{annualized})}} \quad (15)$$

## Vehicle Fuel Expenditures

Fuel prices, by month, were obtained from the following Energy Information Administration survey questionnaires:

- Form EIA-782A<sup>10</sup> “Refiners’/Gas Plant Operators’ Monthly Petroleum Product Sales Report.”
- Form EIA-782B<sup>11</sup> “Resellers’/Retailers’ Monthly Petroleum Product Sales Report.”
- Form EIA-888<sup>12</sup> “On-Highway Diesel Fuel Price Survey.”
- Form EIA-895<sup>13</sup> “Monthly Quantity and Value of Natural Gas Report.”
- Form EIA-826<sup>14</sup> “Monthly Electric Utility Sales and Revenue Report with State Distributions.”

Unfortunately, respondents were not asked the type of fuel purchased for their transportation demands. Further, respondents were not queried on the grade of their purchased fuels. Thus, fuel type was imputed to a sample vehicle based on its representative “match” with the selected vehicle from the NHTSA files. A matching record was chosen from among the several applicable ones, with probability proportional to sales, using the sales figures on the NHTSA files. Once chosen, a record provided (1) EPA Composite MPG, (2) fuel metering, and (3) engine type. The later two items provided enough information to impute a fuel type to a “matched” sample vehicle.

The EIA price series are published by month, by State, 5 PAD districts (PADD), and by type and grade of fuel. For the 2001 NHTS, annual fuel

---

<sup>10</sup> Price and volume data at a State level for 14 petroleum products for various retail and wholesale marketing categories are reported by the universe of refiners and gas plant operators.

<sup>11</sup> Price and volume data at the State level for gasoline, No. 2 distillate, propane, and residual fuel are reported by a sample of distillate fuel oil resellers and retailers, motor gasoline wholesalers, and residual fuel oil resellers and retailers.

<sup>12</sup> The Form EIA-888 survey collects data on the National and Petroleum Administration for Defense (PAD) District level cash price of self-serve, motor vehicle diesel fuel. The data are used to monitor changes in motor vehicle diesel fuel prices and to report to the Congress and others when requested. Respondents are a scientifically selected sample of companies owning retail outlets which sell motor vehicle diesel fuel.

<sup>13</sup> Monthly and annual production data are collected from the appropriate agencies of the natural gas producing States.

<sup>14</sup> Form EIA-826 collects information from regulated and unregulated companies that sell or deliver electric power to end users, including electric utilities, energy service providers, and distribution companies..

expenditures,  $E_i$ , was estimated by multiplying monthly gasoline prices by monthly consumption to produce monthly expenditures, summing over the monthly expenditures derived annual expenditures.

## Gasoline Prices

Prices published by the EIA supplier surveys are pre-tax prices for conventional, oxygenated, and reformulated motor gasoline. Pre-tax prices were supplemented with Federal and State tax rates, by month, to derive retail motor gasoline prices; information on tax rates for gasoline are available from the Federal Highway Administration's web site. These pre-tax prices are published monthly, by State, in EIA's *Petroleum Marketing Monthly*, which includes price (excluding taxes) and volume data at a State level for 14 petroleum products for various retail and wholesale marketing categories are reported by the universe of refiners and gas plant operators.

Because the NHTS did not collect the type or grade of gasoline consumed in each sampled vehicle, gasoline prices were assigned a monthly fuel price that represents the State's volume-weighted average of gasoline by type.

Because the NHTS did not collect the type or grade of diesel consumed in each sample vehicle, diesel price was assigned to a diesel-powered vehicle based on a monthly fuel price represented by a PAD that includes the State in which the sample vehicle resides, according to NHTS, with the notable exception of the state of California where assignment was completed within state geographic boundaries.

More detail about the supplemental energy-related data for the 2001 NHTS can be found in the methodology paper on the EIA website:

[http://www.eia.doe.gov/emeu/rtecs/nhts\\_survey/2001/index.html](http://www.eia.doe.gov/emeu/rtecs/nhts_survey/2001/index.html)

## Variable Names

1. **EIADMPG** – RECOMMENDED MPG MEASURE. EIA derived/adjusted miles per gallon estimate. Because of alternate-fuel vehicles, this is a 5-digit (####.#) derived estimate. Note this value represents an adjusted **EPATMPG** variable (see below).
2. **EPATMPG** – EPA estimate of 55/45 combined total MPG, unadjusted for discount factors. This is a 5-digit (####.#) estimate obtained from EPA test data.
3. **GSCOST** – should be a 6-digit (####.##) Fuel cost estimated in

cents per gallon (diesel or gasoline) in local area, based on the sample household location.

4. **BTUCOST** – should be a 6-digit (###.##) Fuel cost estimated in units of cents per gasoline equivalent gallon for electric or compressed natural gas vehicles, rather than cents per physical gallon.
5. **BESTMILE** – should be a 6-digit (#####) Estimated annual miles this car was driven (derived by ORNL). These values represent ORNL's (see ORNL APPENDIX of the User's Guide) estimate of miles driven for a sample vehicle.
6. **GSTOTCST** – 4-digit (####) Total dollar cost of fuel per year for gasoline and diesel vehicles (derived from **GSCST** and **GSYRGAL**).
7. **BTUTCOST** – 4-digit (####) Total dollar cost of fuel per year (derived from **BTUCOST** and **BTUYEAR**). This value is available for non-gasoline and -diesel vehicles.
8. **GSYRGAL** – 4-digit (####) estimate of the number of gallons of gasoline consumed per year. This value is derived from **BESTMILE** and **EIADMPG**.
9. **BTUYEAR** – 4-digit (####) estimate of the amount of gasoline equivalent gallons consumed per year. This value is derived from **BESTMILE** and **EIADMPG** and is available for non-diesel and -gasoline vehicles.
10. **FUELTYPE** – 1-digit (#) classification code for fuel consumed in a sample vehicle, where 1 represents diesel, 2 represents natural gas, 3 represents electricity, and 4 represents motor gasoline.

This appendix describes the methods developed to estimate: (1) vehicle fuel economy (in terms of miles per gasoline equivalent gallon (MPG)), (2) vehicle fuel consumption, and (3) vehicle fuel expenditures. The MPG was estimated for most of the vehicles in the 2001 NHTS NATIONAL SAMPLE, while fuel consumption and fuel expenditures were estimated for vehicles whose *BESTMILE* was estimated. The methods and the estimates were developed using the January 2003 data. Since then, some of the critical data used in the development of the *BESTMILE* estimates were modified during the editing process for the January 2004 Version of the NHTS data. Due to the time constraints, the fuel economy and fuel consumption estimates were not updated to reflect January 04 data. Fuel economy and fuel consumption for vehicles where the underlying data changed between the January 2003 Version and the

January 2004 Version were set to “Not Ascertained,” and the associated data flag ,*BEST\_FLG*, was set to “No Best Estimate, underlying values changed in editing.” Numbers found in this appendix reflect the January 2003 NATIONAL SAMPLE data, and may not be identical to those found in the January 2004 data.

## Summary Tables

**Table 3. Number of Vehicles, Vehicle Miles, Motor Fuel Consumption and Expenditures, 2001**

# APPENDIX L

## MAKE AND MODEL CODES FOR THE 2001 NHTS VEHICLE FILE

The codes used for vehicle make and model are from the 2002 Fatality Analysis Reporting System (FARS), a major database created and maintained by the National Highway Traffic Safety Administration (NHTSA). These make and model codes are identical to those used in the National Automotive Sampling System database, which was used for the 1995 NPTS. The 2002 FARS listing is more up to date than currently-available NASS listing.

This Appendix contains the portion of the FARS documentation identifying the codes that were used in the NHTS. Within the Appendix, the codes are in alphabetical order by vehicle make. A summary listing in numerical order is provided below.

For cases when the respondent **refused to identify** either the make or model, it was denoted by a -7 in the corresponding data field. Similarly, when the respondent indicated that they **did not know** either the make or model, it was denoted by a -8.

Note that a code 91 was used in the survey data for both make and model to represent Other (Specify). However, the 2002 FARS database includes a Make Code 91 (Eagle Coach). There were no Eagle Coach vehicles reported in the 2001 NHTS. Consequently all vehicles in the survey database with a make code = 91 represent Other Vehicle Make.

## APPENDIX M

### 2001 NHTS QUESTIONNAIRE

This Appendix contains the household and person questionnaires that were used during the 2001 NHTS Survey. The questionnaires are annotated with:

- Variable names that were used in the CATI program (in all caps, bold text and in parenthesis after each question),
- Programmer notes that indicate which questions were asked and under what conditions (in all caps, bold text and in boxes),
- Displays (denoted by text in { }'s. Information displayed here was automatically displayed by the CATI program and is designed to personalize the questionnaire),
- Screen names that were used in the CATI (the number in parenthesis following the question number), and
- Notes to the interviewers that are read to respondents only when needed (in bold, all caps and in [ ] brackets).

Question and response category text was read aloud to respondents if it was in lower and upper case. All other text was for the interviewers.

The questionnaire was administered in both English and Spanish. Pages 2 through 101 contain the English version. The Spanish version begins on page 102; it does not contain programmer notes.

**NATIONAL HOUSEHOLD TRAVEL SURVEY**

**Telephone (CATI) Questionnaire**

**HOUSEHOLD (SCREENER) INTERVIEW**

**SECTION A: TELEPHONE NUMBER SCREENING**

**PROGRAMMER NOTE:**

**DISPLAY AT THE TOP OF EACH SCREEN IF THE HOUSEHOLD RECEIVED AN ADVANCE LETTER  
{LETTER SENT/NO LETTER SENT}.**

A1. (SINTRO\_1 & SINTRO\_3)

Hello, this is {INTERVIEWER'S NAME} and I'm calling for the U.S. Department of Transportation. We are conducting the National Household Travel Survey.

(RESIDENTIAL)

Are you a member of this household  
and at least 18 years old?

**(SHHQUX1)**

YES..... 1  
NO..... 2  
PROBABLE BUSINESS ..... 3  
ANSWERING MACHINE .....AM  
RETRY AUTODIALER.....RT  
NONWORKING,  
DISCONNECTED, CHANGED...NW  
GO TO RESULT .....GT

(BUSINESS)

Is this phone number used for...

**(SFONEUSE)**

Home use, ..... 4 GO TO BINTRO  
Home and business use, or..... 5 GO TO BINTRO  
Business use only?..... 6  
GO TO RESULT ..... GT

**[HOME USE EXCLUDES PHONES IN MOTELS, HOTELS, GROUP QUARTERS SUCH AS NURSING HOMES, PRISONS, BARRACKS, CONVENTS OR MONASTERIES AND ANY LIVING QUARTERS WITH 10 OR MORE UNRELATED ROOMMATES.]**

**SECTION B: VEHICLE DATA**

**PROGRAMMER NOTE:**

**IN BINTRO, IF THE SAMPLED TELEPHONE NUMBER IS IN WISCONSIN, DISPLAY "Wisconsin". IF THE NUMBER IS IN NEW YORK STATE, DISPLAY "New York". ELSE, DISPLAY "your area".**

BINTRO The purpose of this survey is to understand your travel and to help improve transportation in {Wisconsin/New York/your area}.

Your participation is voluntary, and your answers will be completely confidential.

**[IF ASKED: The survey has been authorized by Title 23, United States Code. The OMB clearance numbers are 2139-0008 and 2125-0545 with an expiration date of February 29, 2004.]**

**[PRESS RETURN TO CONTINUE.]**

**PROGRAMMER NOTE:**

**RANGE FOR HHNUMVEH = 0-10.**

B1. My first questions are about vehicles.

How many vehicles are owned, leased, or available for **regular use** by the people who currently live in your household? Please be sure to include motorcycles, mopeds and RVs.

**(HHNUMVEH)**

**[INCLUDE LEASED OR COMPANY-OWNED MOTORIZED VEHICLES IF THEY ARE USED BY HOUSEHOLD MEMBERS ON A REGULAR BASIS.]**

NUMBER OF VEHICLES.....			
NONE .....	0		GO TO B5
REFUSED .....	-7		GO TO B5
DON'T KNOW .....	-8		GO TO B5

**PROGRAMMER NOTE:**

**IN VMAT SERIES, DISPLAY VEHICLE MATRIX.**

**HARD RANGE FOR VEHYEAR = 1930-2002.**

**IF HHNUMVEH > 1 USE DISPLAY IN VMAT2Y THROUGH VMAT6Y, ELSE USE NO DISPLAY.**

**IF VEHICLE TYPE CAN BE AUTOCODED DO SO AND DISPLAY TYPE.**

**IF VEHI.MODLCODE IS:**

- 1-399, AUTOCODE (VMAT6Y) VEHI.E\_VTYPE = 1,
- 441-443, 461, OR 466 AUTOCODE (VMAT6Y) VEHI.E\_VTYPE = 2,
- 401-404, 421-423, OR 431, AUTOCODE (VMAT6Y) VEHI.E\_VTYPE = 3,
- 471-472, OR 481-482, AUTOCODE (VMAT6Y) VEHI.E\_VTYPE = 4,
- 850, AUTOCODE (VMAT6Y) VEHI.E\_VTYPE = 6,
- 700-739, AUTOCODE (VMAT6Y) VEHI.E\_VTYPE = 7,
- ELSE, ASK VMAT6Y DIRECTLY AFTER VEHYEAR IS RECORDED.

**ALLOW INTERVIEWERS TO ENTER 91 AND RECORD OTHER SPECIFY FOR VEHICLES NOT IN THE TABLE.**

**VEHI.VEHYEAR IS THE MODEL YEAR OF THE VEHICLE.**

**VEHI.WHEREFLG INDICATES WHERE THE VEHI RECORD WAS CREATED.**

**VEHICNT IS THE COUNT OF VEHICLES IN THE MATRIX ON THE DATE OF THE SCREENER.**

B2. (VMAT2Y THROUGH VMAT6Y)

{I have a few questions about each of these vehicles. Let's start with the newest vehicle.} What is the make, model and year of this vehicle?

<u>KEY</u>	<u>MAKE</u> (MAKECODE)	<u>MODEL</u> (MODLCODE)	<u>YEAR</u> (VEHYEAR)	<u>TYP</u> (VEHTYPE)
01				
02				
03				
04

**IF SCR.NSELTCNT = 1, AUTOCODE CURRENT SUBJECT IN DRVR\_FLG, WHODROVE AND GO  
TO BOX AFTER G49 (N\_G34).**

**IF (G48 (N\_G33)) HMEMDRV = 1 OR 3 AND (G44 (N\_G31)) TRPHACC = 2 CODE CURRENT  
SUBJECT AS DRIVER IN DRVR\_FLG, WHODROVE AND GO TO BOX AFTER G49 (N\_G34).**

**ELSE, DISPLAY HHMS 15 AND OLDER OR HHMS WHOSE AGE IS MISSING IN G49 (N\_G34) AND  
ALLOW INTERVIEWER TO SELECT ONE.**

G49. (N\_G34) Who was the driver?  
(DRVR\_FLG, WHODROVE)

**[IF NEEDED: Which one drove the longest distance?]**

ENTER 1 FOR DRIVER

REFUSED ..... -7  
DON'T KNOW ..... -8

**PROGRAMMER NOTE:**

FOR HHM ENTERED IN (G49 (N\_G34)) DRVR\_FLG, WHODROVE, VERIFY THAT HE/SHE WAS REPORTED TO BE ON THIS TRIP (G45 (N\_G32)) (EVEN IF REPORTED BY A PREVIOUS HHM) AND THAT HE/SHE IS LISTED AS DRIVER IN HH ROSTER. IF NOT ON TRIP, ASK IF HHM WAS ON TRIP AND MODIFY G45 (N\_G32). ASK IF HHM SHOULD BE RECORDED AS A DRIVER AND MODIFY ENUM.DRVR IN SCREENER.

GO TO BOX BEFORE G26 (N\_G22) FOR NEXT TRIP (IF THIS IS NOT AN ADD-ON), OR THE PROGRAMMER NOTE AFTER G19 (N\_G20) (IF AN ADD-ON), OR TO INTRO\_H IF TRIP DETAIL HAS BEEN OBTAINED FOR ALL TRIPS.

## SECTION H: FARTHEST TRIP ROSTERING

### SEGMENT - TRIP

#### INTRO\_H.

Now I'd like you to think back to the, 4-week, period between {SCRN.TPBDATE} and {SCRN.TPEDATE}. I'm going to ask you some questions about {your/SUBJECT} **long-distance** travel during that time. These are trips where the **farthest** destination was **at least 50 miles** away from your home even if you did not begin the trip at home. Only include trips that ended between {SCRN.TPBDATE} and {SCRN.TPEDATE}.

[PRESS RETURN TO CONTINUE.]

#### PROGRAMMER NOTE:

IF A PREVIOUS HHM INDICATED THAT THE CURRENT RESPONDENT WAS ON A LONG DISTANCE TRIP (I3), AUTOFILL THE CITY, STATE, DEPARTURE AND RETURN FIELDS FOR THAT TRIP.

IN THE MATRIX, FOR SCREENS GATHERING THE DEPARTURE AND RETURN DATES, DISPLAY "RECORD ALL TRIPS THAT ENDED BETWEEN {TPBDATE} AND {TPEDATE}".

FOR DELIVERY RETAIN ONLY TRIPS WHERE LVE MNT, LVEDAY, LVEYR AND RETMNT, RETDAY, RETYR ARE LE TPEDATE.

#### PROGRAMMER NOTE:

IF THE CURSOR IS IN THE FIRST OR SECOND ENTRY FIELDS DISPLAY "What was the farthest city..." THROUGH THE INTERVIEWER INSTRUCTIONS.

IF RESPROXY = 1 USE "you" IN DISPLAYS, ELSE USE "SUBJECT".

IF THE CURSOR IS IN THE THIRD ENTRY FIELD USE THE NEXT DISPLAY.

IF THE CURSOR IS IN THE FOURTH ENTRY FIELD USE THE NEXT DISPLAY.

IF THE CURSOR IS IN THE FIFTH ENTRY FIELD DISPLAY "Was this trip..." AND ALLOW ENTRIES OF 1 OR 2. IF RECURR = 1 DISPLAY "YES" IN THE COLUMN, ELSE DISPLAY "NO".

IF RECURR = 1 MOVE CURSOR TO SIXTH ENTRY FIELD AND DISPLAY "Altogether, how many...". HARD RANGE FOR NTIMES = 1 - 99, SOFT RANGE = 1 - 50.

FOR LVE MNT/LVEDAY/RETMNT/RETDAY ALLOW ONLY VALID DAY AND MONTH COMBINATIONS TO BE ENTERED. [I.E., IF MONTH IS 02, DAY CAN NOT BE > 29, ETC.]

VERIFY THAT A VALID STATE ABBREVIATION IS ENTERED.

H1. (H2\_4) {What was the farthest city and state {you/SUBJECT} reached on the first /next trip that took {you/SUBJECT} 50 miles or more away from home?  
**(FARCTY, FARST)**

**[IF AN INTERNATIONAL TRIP, ENTER THE NAME OF THE COUNTRY AND CITY IN THE CITY FIELD AND "ZZ" IN THE STATE FIELD.]**

**[IF R PROVIDES A PLACE, I.E. "Disney World," AND IS UNABLE TO PROVIDE CITY WHEN PROBED, ENTER THE PLACE PROVIDED IN THE CITY FIELD.]**

{On what date did {you/SUBJECT} begin this trip?}  
**(LVE MNT, LVE DAY, LVE YR)**

{On what date did {you/SUBJECT} return home after completing this trip?}  
**(RET MNT, RET DAY, RET YR)**

{Was this trip made more than one time during this 4-week period for the **same** reason?}  
**(RECURR) [1=YES, 2=NO]**

{Altogether, how many times did {you/SUBJECT} make this trip between {SCRN.TPBDATE} and {SCRN.TPEDATE}?}  
**(NTIMES)**

[CITY]	[STATE]	[DEPARTURE DATE]	[RETURN DATE]	RECUR	FREQ
		MTH DAY YEAR	MTH DAY YEAR		
_____	_____	_____	_____	_____	_____

**PROGRAMMER NOTE:**

**IF NO LONG DISTANCE TRIPS ARE RECORDED IN H1 (H2\_4) DISPLAY H2 (TRIPCHK), ELSE GO TO NEXT PROGRAMMER NOTE.**

H2. (TRIPCHK) Let me verify that between {TPBDATE} and {TPEDATE} you did not make **any** trips that took you 50 miles or more away from home?  
**(TRIPCHK)**

CORRECT, NO MORE TRIPS..... 1 GO TO BOX BEFORE K1  
 ADD TRIPS ..... 2 RETURN TO MATRIX

**PROGRAMMER NOTE:**

**IN H3 (TRIPCHK1) DISPLAY THE NUMBER OF TRIPS RECORDED IN H1 (H2\_4). IF NTIMES IS NOT MISSING INCLUDE THE NUMBER RECORDED THERE IN THE COUNT OF TOTAL TRIPS.**

**IN H3, DISPLAY “including trips on {TRDDATE}” IF A CHECK OF TRIPDIST AND TRIPUNIT (G40 (N\_G24)) SHOWS THAT THE SUBJECT MADE AT LEAST ONE TRIP WHERE MILES IS GE 50 OR BLOCKS IS GE 450. DO NOT COUNT TRIPS WHERE G12 (G15A) (WHERE) IS “HOME.”**

H3. (TRIPCHK1) I have recorded that you made {N} trips of 50 miles or more away from home between {TPBDATE} and {TPEDATE}? Have I missed anything {including trips on {TRDDATE}}? (TRIPCHK1)

CORRECT, NO MORE TRIPS..... 1  
ADD TRIPS ..... 2      RETURN TO MATRIX

**PROGRAMMER NOTE:**

**COMPARE THE CURRENT SUBJECT’S RESPONSES TO H1 (H2\_4) TO THOSE PROVIDED BY HHMS WHO HAVE INDICATED THAT THE SUBJECT WAS ON THE TRIP WITH THEM (USE I3).**

**IF THIS TRIPS DETAIL WAS REPORTED BY ANOTHER HHM, DISPLAY: “We have recorded that {FNAME/AGE/SEX OF OTHER HHMS ON TRIP} {was/were} with {you/SUBJECT} on the trip to {FARCTY, FARST}. From the time {you/s(he)} left until the time {you/s(he)} returned home, did {you/s(he)} travel together with {him/her/them} on all legs of the trip?”**

**IF NO OR IF THE YES APPLIES TO ONLY SOME HHMS NAMED, ADMINISTER SECTIONS I AND J (IF RETMNT, RETDAY, RETYR NE LVEMNT, LVEDAY, LVEYR).**

**IF YES, DO NOT ADMINISTER SECTIONS I OR J FOR THIS TRIP. INSTEAD, COPY EXISTING DATA TO CURRENT SUBJECT.**

**IF THERE WAS AN EXACT TRIP MATCH VARIABLE TRIP.TRIPLINK SHOWS THE ID OF PERSON ON WHOSE RECORD THE MATCHED TRIPS ARE STORED.**

**IF NTIMES > 1, ASK TRIP DETAIL (SECTION I) ONLY ONCE FOR THIS TRIP.**

**SECTION I: FARTHEST TRIP DETAIL**

**PROGRAMMER NOTE:**

**IN REMAINING SECTIONS, IF RESPROXY = 1 USE "you", "yourself" AND "your" IN DISPLAYS AS APPROPRIATE, ELSE USE SUBJECT, "him/her", "s(he)" AND "his/her".**

**ASK SECTIONS I AND J (IF FARSTOP OR RETSTOP = 1) FOR EACH FARCTY, FARST.**

**AFTER ALL FARCTY AND FARST RECORDS HAVE BEEN ASKED ABOUT, GO TO BOX BEFORE K1.**

**SEGMENT - TRIP**

11. Next, I'd like to get some more detail about {your/SUBJECT} round trip to {FARCTY, FARST} that began on {LVEMNT, LVEDAY, LVEYR} and ended on {RETMNT, RETDAY, RETYR}.

**[PRESS RETURN TO CONTINUE.]**

**PROGRAMMER NOTE:**

**IF SCR.NSELCTCNT > 1 GO TO I2, ELSE GO TO I4.**

12. Not counting {yourself/SUBJECT}, how many members of {your/his/her} household traveled with {you/SUBJECT} on the trip to {FARCTY, FARST}?

**SEGMENT - TRIP**

INTRO\_H.

Ahora me gustaría que usted pensara en las 4 semanas entre {SCRN.TPBDATE} y {SCRN.TPEDATE}. Voy a hacerle algunas preguntas sobre viajes {suyos/de SUBJECT} de **larga distancia**, durante ese tiempo. Estos son viajes donde el viaje de **mayor** distancia fue de **por lo menos 50 millas** lejos de su casa, aún si usted no comenzó el viaje desde su casa. Incluya solamente viajes que terminaron entre el {SCRN.TPBDATE} y el {SCRN.TPEDATE}.

**[PRESS RETURN TO CONTINUE.]**

H1. (H2\_4) {¿Cuál fue la ciudad y estado más lejos al que {usted/SUBJECT} llegó en el primer/siguiente viaje que le llevó a {usted/SUBJECT} alejarse de casa 50 o más millas?  
(FARCTY, FARST)

**[IF AN INTERNATIONAL TRIP, ENTER THE NAME OF THE COUNTRY IN THE CITY FIELD AND "ZZ" IN THE STATE FIELD.]**

**[IF R PROVIDES A PLACE, I.E. "Disney World," AND IS UNABLE TO PROVIDE CITY WHEN PROBED, ENTER THE PLACE PROVIDED IN THE CITY FIELD.]**

{¿En qué fecha comenzó {usted/SUBJECT} este viaje?  
(LVEMNT, LVEDAY, LVEYR)

{¿En qué fecha regresó {usted/SUBJECT} a casa después de completar este viaje?  
(RETMNT, RETDAY, RETYR)

{¿Este viaje se hizo más de una vez durante este período de 4 semanas por la **misma** razón?  
(RECURR) [1=YES, 2=NO]

{En total, cuántas veces hizo {usted/SUBJECT} este viaje entre el {SCRN.TPBDATE} y el {SCRN.TPEDATE}?  
(NTIMES)

[CITY]	[STATE]	[DEPARTURE DATE] MTH DAY YEAR	[RETURN DATE] MTH DAY YEAR	RECUR	FREQ
_____	_____	_____	_____	_____	_____

H2. (TRIPCHK) Permítame verificar que entre {TPBDATE} y {TPEDATE} {usted/SUBJECT} no hizo **ningún** viaje que le haya alejado a {usted/SUBJECT} de casa por 50 o más millas?

CORRECT, NO MORE TRIPS..... 1 GO TO BOX BEFORE K1  
ADD TRIPS ..... 2 RETURN TO MATRIX

H3. (TRIPCHK1) He anotado que usted hizo {N} viajes de 50 o más millas lejos de casa entre el {TPBDATE} y el {TPEDATE}? ¿Me he equivocado en algo {incluyendo viajes el día {TRDDATE}}?

CORRECT, NO MORE TRIPS..... 1  
ADD TRIPS ..... 2 RETURN TO MATRIX

**SECTION I: FARTHEST TRIP DETAIL**

**SEGMENT - TRIP**

11. Ahora me gustaría obtener un poco más de detalle acerca del viaje ida y vuelta {suyo/de SUBJECT} a {FARCTY, FARST} que comenzó el {LVMNT, LVEDAY, LVEYR} y terminó el {RETMNT, RETDAY, RETYR}.

# APPENDIX N

## NHTS FIELD DOCUMENTS

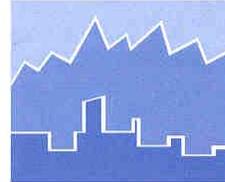

This Appendix contains samples of the documents used during the conduct of the 2001 NHTS. The first 19 documents are those used by Westat. Documents 20 through 32 were used by Morpace. The documents are included in the appendix in the following order:

1. Pre-Interview letter and envelope,
  2. English Brochure sent with the pre-interview letter and also with the travel diary package,
  3. Spanish Brochure sent with the travel diary package,
  4. English cover letter sent with the travel diary package,
  5. Spanish cover letter sent with the travel diary package,
  6. English travel day diary sent with the travel diary package,
  7. Spanish travel day diary sent with the travel diary package,
  8. Reminder note (English and Spanish) for travel day sent with the travel diary package,
  9. English map showing demarcating a distance of 50 miles from the subject's home sent with the travel diary package,
  10. Spanish map showing demarcating a distance of 50 miles from the subject's home sent with the travel diary package,
  11. English first odometer reading form mailed with the travel diary package,
  12. Spanish first odometer reading form mailed with the travel diary package,
  13. English second odometer reading form mailed to the household at least two months after the receipt of the first set of odometer readings,
  14. Spanish second odometer reading form mailed to the household at least two months after the receipt of the first set of odometer readings,
  15. Form used by telephone interviewers to collect the first odometer reading if not collected during person interview,
  16. Form used by telephone interviewers to collect the second odometer reading if not received via the mail, Internet, facsimile or the toll-free number,
  17. Form used by telephone interviewers the day before the travel day to remind the household of the travel day,
  18. Missed Trip information sheet – Travel Day Trips, and
  19. Missed Trip information sheet – Long Distance Trips.
- 
20. Morpace: Pre-Interview Letter, Texas
  21. Morpace: Pre-Interview Letter, Baltimore
  22. Morpace: Pre-Interview Letter, Hawaii
  23. Morpace: Pre-Interview Letter, Iowa
  24. Morpace: Pre-Interview Letter, Kentucky
  25. Morpace: Pre-Interview Letter, Lancaster
  26. Morpace: Pre-Interview Letter, Oahu

27. Morpace: Cover letter sent with the diary package
28. Morpace: English travel day diary
29. Morpace: Spanish travel day diary
30. Morpace: Reminder post card
31. Morpace: Form to record additional travel day trips
32. Morpace: Form to record additional travel period trips for Texas.

U. S. Department  
of Transportation

National Household  
Travel Survey

**Are you concerned about traffic?** Travel and traffic have increased everywhere. The U. S. Department of Transportation is conducting a survey of people all across the nation to better understand travel and evaluate plans for the future. The National Household Travel Survey is about how we travel in our daily lives. We are interested in all of the ways that you travel from one place to another, including trips by car, bus, train, airplane, and boat, as well as walking and bicycling trips.

In about a week, an interviewer for the National Household Travel Survey will call and ask some questions about you and your household. Your participation is voluntary, and we promise that any personal or identifying information will be kept confidential.

This survey is so important for the future of our nation's transportation that we have included a small token of our appreciation. You are unique, and no one can substitute for you. Each selected household represents about 4,000 other households. Together you and the other participants will help provide an accurate picture of how we travel.

For more information about the survey, you may visit our website at:

**[www.bts.gov/nhts](http://www.bts.gov/nhts)**

If you have any questions, you may call our survey manager, Mark Freedman, at **1-888-813-7447**. You may also contact Susan Liss, our project manager at the U.S. Department of Transportation at **1-800-307-8243**.

I would like to thank you in advance for your participation.

Sincerely yours,

**Norman Y. Mineta**  
Secretary of Transportation

 U. S. Department  
of Transportation

*Please  
Open Now*

..... Official Business .....

*We need YOU...*  
Your participation helps us make the right decisions about future improvements.

## What It Is All About

The U.S. Department of Transportation collects information about your travel to understand how well the roads and highways, bus, and rail systems are working, and to plan for the future. We are asking you to help us by taking part in this survey. Your answers help us build a snapshot of how, when, and why people travel in their daily lives.

## Tell Us About Your Travel

You and the members of your household are asked to keep track of all the places you go, by any type of transportation, for one day. A diary will be sent to you to help you keep track of your travel. We will also ask you about recent travel to places further away from home.

## About the Survey

The American public has been telling us about their travel periodically since 1969. The results have been used to help improve safety, track air quality improvements, and plan for future transportation investments. If you would like to know more about the survey please visit our website at:

[www.bts.gov/nhts](http://www.bts.gov/nhts)

## Questions?

Call Toll-Free at **1-888-813-7447**

## What's In It For You?

**Satisfaction:** Good decisions need good information. You can make a difference!

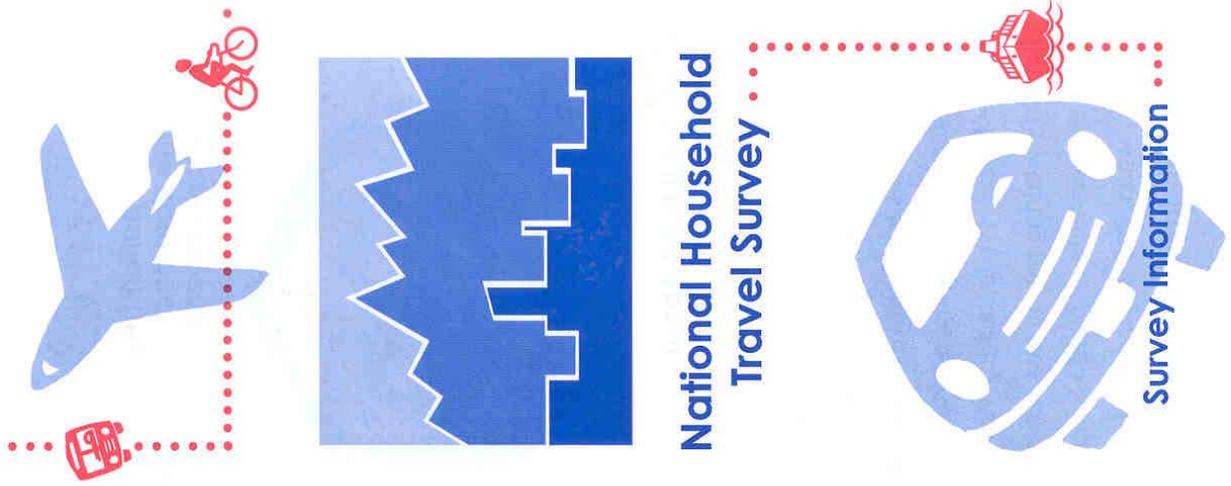

**Importance:** We picked **You** to represent 4,000 others. Your travel information is very important.

**Enjoyment:** Our telephone interviewers are well-trained and courteous. We hope you will enjoy talking to them.

**Security:** Your name, address, telephone number, and other personal information **WILL NOT** be released to anyone. **We respect and protect your privacy!**

**Appreciation:** On behalf of the project team, we thank you for your time, trust, and participation!

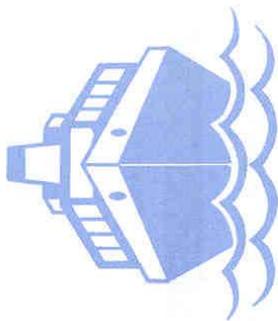

# Thank you

*from our project sponsors:*

- Bureau of Transportation Statistics
- Federal Highway Administration
- National Highway Traffic Safety Administration

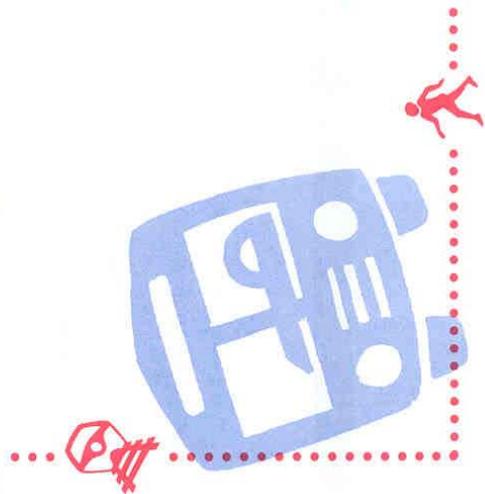

U. S. Department of Transportation

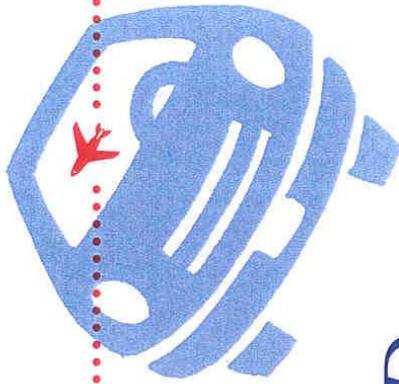

## Your Answers Are Important

Did you know that an average household spends more on transportation than on groceries or entertainment? Every year the U.S. DOT spends billions of taxpayer dollars in transportation improvements. You can make sure these dollars are spent wisely by being part of our travel research group.

*Necesitamos de usted...  
Su participación nos ayuda a  
tomar las decisiones correctas  
para hacer mejoras en el futuro.*

## ¿De qué se trata?

El Departamento de Transporte de los Estados Unidos recoge información sobre sus recorridos para conocer qué tan bien funcionan las calles y autopistas, los autobuses y trenes, así como planear para el futuro. Le estamos pidiendo que nos ayude participando en esta encuesta. Sus respuestas nos ayudan a construir una imagen de cómo, cuándo y por qué la gente se moviliza diariamente de un lado para otro.

### Díganos acerca de sus recorridos

Durante un día, a usted y a los miembros de su hogar se les pide que anoten todos los lugares adonde vayan, usando cualquier medio de transporte. Se le enviará una hoja de registro adonde usted puede anotar sus recorridos. También le preguntaremos sobre viajes recientes a lugares más alejados del hogar.

### Acerca de la Encuesta

Periódicamente desde 1969, el público norteamericano nos ha estado informando acerca de recorridos y viajes que hace. Los resultados han sido usados para ayudar a mejorar la seguridad, anotar mejoras en la calidad del aire y a planear inversiones futuras de transportación. Si usted quisiera conocer más acerca de esta encuesta, por favor visite nuestro sitio de la Internet:

[www.bts.gov/nhts](http://www.bts.gov/nhts)

**¿Preguntas? Llame al número gratis 1-888-813-7447**

### ¿De qué manera se favorece usted?

**Satisfacción:** Para tomar buenas decisiones, se necesita buena información. ¡Usted puede ayudar a hacer la diferencia!

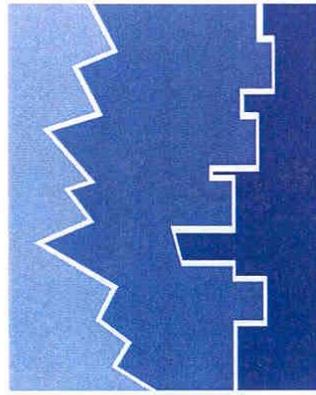

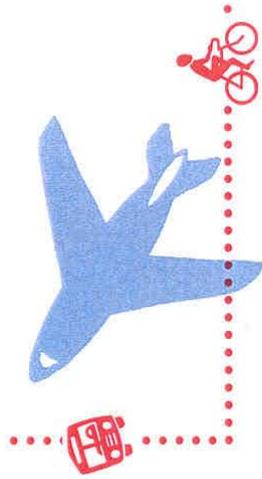

**Importancia:** Usted fue seleccionado para representar a otras 4,000 personas. Es muy importante conocer sobre sus recorridos y viajes.

**Experiencia Agradable:** Nuestros entrevistadores telefónicos están bien entrenados y son amables. Esperamos que usted tenga una experiencia agradable al hablar con ellos.

**Seguridad:** Su nombre, dirección, número telefónico y otra información personal **NO** se divulgará a nadie. **¡Respetamos y protegemos su privacidad!**

**Agradecimiento:** ¡De parte del equipo del proyecto, agradecemos su tiempo, confianza y participación!

## Encuesta Nacional de Transporte en el Hogar

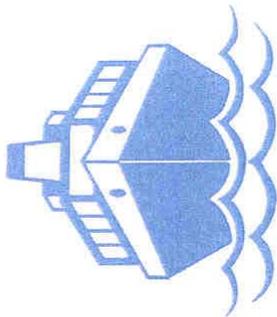

# Muchas Gracias

*de parte de nuestros patrocinadores del proyecto:*

- Bureau of Transportation Statistics
- Federal Highway Administration
- National Highway Traffic Safety Administration

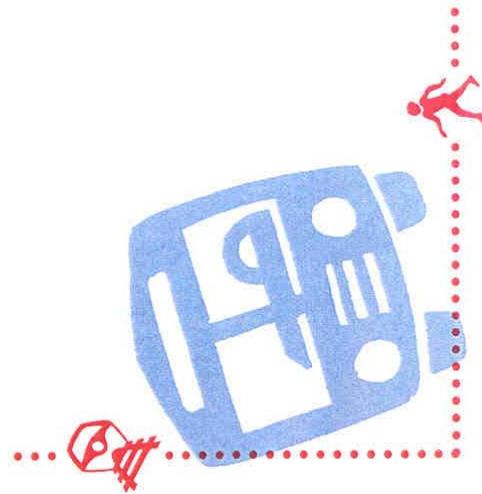

U. S. Department of Transportation

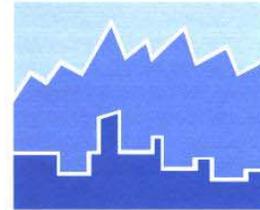

## Sus respuestas son importantes

¿Sabía usted que un hogar promedio gasta más en transportación que en supermercado o entretenimiento? Cada año el Departamento de Transporte de los Estados Unidos gasta miles de millones de dólares, recogidos en impuestos, para hacer mejoras en la transportación. Puede asegurarse que estos dólares se gastan cuidadosamente al ser usted parte de nuestro grupo que investiga movilización y transportación.

U. S. Department  
of Transportation

National Household  
Travel Survey

Dear Respondent:

**Thank You!** On behalf of the U.S. Department of Transportation, I thank you and the members of your household for taking part in the *National Household Travel Survey*.

As we explained in our recent telephone call, this packet provides everything your household will need to record your travel for our interview.

- A travel diary for each household member with instructions and an example on the back.
- A card reminding you of the assigned travel day. *Please put it where everyone can see it, such as on your refrigerator.*
- A brochure telling you more about the study.
- A map to help you note any recent travel to places further from home.
- A form to record the odometer (mileage) readings from each household vehicle.

Please record all trips that you and each member of your household take on your assigned travel day. **We ask each member to complete his or her own diary whenever possible.** Even if your travel on that day is not typical, we still want to know about it. If you are uncertain about whether to include a trip, go ahead and record it.

After your assigned travel day, we will call you to ask some additional questions about transportation. We will also ask about recent travel to places further away from home during the four weeks before your travel day. We would like to talk to each person age 16 or older individually, but ask that an adult respond for younger household members.

The information you give us will be held confidential, nothing will be shared that could identify you or your household. We really appreciate your participation—it is extremely important for planning for future transportation.

If you have any questions, you may contact the survey team toll free at 1-888-813-7447 or by e-mail at [DOTSurvey@Westat.com](mailto:DOTSurvey@Westat.com). Thank you once again for participating in the survey.

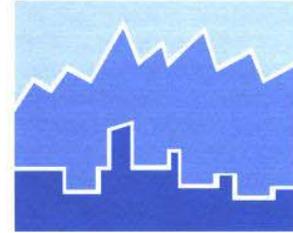

Sincerely,

Susan Liss  
U.S. Department of Transportation

Travel Day: Saturday, March 23  
14110595

U. S. Department  
of Transportation

National Household  
Travel Survey

Estimado(a) Respondent:

¡**Muchas Gracias!** De parte del Departamento de Transportación de los Estados Unidos, agradezco a usted y miembros de su hogar por participar en la *Encuesta Nacional de Transporte en el Hogar*.

Como le explicamos en nuestra reciente llamada telefónica, este paquete contiene todo lo que su hogar necesitará para anotar su patrón de movilización para nuestra entrevista.

- Una Hoja de Registro por cada miembro del hogar, con instrucciones y un ejemplo al dorso de la Hoja.
- Una tarjeta recordándole su día asignado para anotar sus recorridos. *Por favor ponga esta tarjeta donde todos puedan mirarla, tal como en el refrigerador.*
- Un folleto informándole más acerca del estudio.
- Un mapa para ayudarle a anotar cualquier viaje reciente a lugares más alejados de su hogar.
- Una Hoja para anotar las lecturas del odómetro (millaje) de cada vehículo del hogar.

Por favor anote todos los recorridos que usted y cada miembro de su hogar hagan durante su día asignado. **Hasta donde sea posible, pedimos que cada miembro complete su propia Hoja de Registro.** Aunque sus recorridos durante ese día asignado no sean típicos para usted, todavía queremos que usted nos dé su información. Si usted no está seguro(a) si debe incluir o no uno de sus recorridos, anótelos de todas maneras.

Después de que pase su día asignado, le llamaremos por teléfono para hacerle unas preguntas adicionales sobre transportación. También preguntaremos sobre viajes recientes a lugares más alejados de su hogar, que hayan sucedido en las cuatro semanas anteriores a su día asignado. Nos gustaría hablar individualmente con cada persona de 16 o más años de edad, pero pedimos que un adulto responda por los miembros del hogar menores de 16 años.

La información que usted nos dé es confidencial y nada se compartirá que pueda identificarlo(a) a usted o a su hogar. De verdad agradecemos su participación – es extremadamente importante para planear futura transportación.

Si usted tiene cualquier pregunta, puede comunicarse con el equipo a cargo de esta encuesta, llamando gratuitamente al 1-888-813-7447 o enviando un e-mail al [DOTSurvey@Westat.com](mailto:DOTSurvey@Westat.com). Una vez más, muchas gracias por participar en la encuesta.

Atentamente,

Susan Liss  
U.S. Department of Transportation

Expiration date: 02/29/2004

# NATIONAL HOUSEHOLD TRAVEL SURVEY

## Instructions for completing your Travel Diary

- Use this diary on your **assigned travel day**, shown on the front.
- The travel day starts at 4:00 a.m. and ends at 4:00 a.m. the next day.
- A **trip** is whenever you travel **from one address to another**. Use one line to record each trip. **Include:**
  - All trips you made for a specific reason, such as to go to work or school, buy gas, or drop someone off.
  - Return trips, such as coming home from work or school.
  - Walks, jogs, bike rides, and short drives. If you started and ended in the same place, list the farthest point you reached and record a return trip.
  - **Do not** include stops just to change the type of transportation.
  - Record all of your child's trips on the child's diary, including the trips that were not taken with an adult member of your household, such as riding the school bus.
- If you made more than ten trips as part of your job (examples: a cab driver, delivery person, police officer):
  - **Don't** record the trips that were made as part of your job.
  - **Do** record the trips that got you to and from your work place.
  - **Do** record all other trips that **were not** part of your job.
- If you made more trips than will fit on the diary, record the rest on a blank sheet of paper.

### Example of Trips on a Travel Day

### NATIONAL HOUSEHOLD TRAVEL SURVEY TRAVEL DIARY

At the beginning of my travel day (4:00 a.m.) I was:  
 Home     Some other place

	WHERE did you go? (Name of place)	What TIME did you start and end each trip?		WHY did you go there?	HOW did you travel?	How FAR was it? (blocks or miles)
		Started at:	Arrived at:			
EXAMPLE:	West Park Theater	2:00 p.m.	2:55 p.m.	To see a movie	walk, bus, walk	6 miles
1.	ABC Office Products	7:35 a.m.	8:43 a.m.	To Work	car, subway, walk	12 miles
2.	New City Diner	12:05 p.m.	12:16 p.m.	Eat Lunch	walk	2 blocks
3.	ABC Office Products	12:58 p.m.	1:10 p.m.	Return to Work	walk	2 blocks
4.	Fast Gas Mart	5:30 p.m.	6:35 p.m.	Buy gas for car	walk, subway, car	11 miles
5.	Super Deal Grocery	6:42 p.m.	6:48 p.m.	Buy groceries	car	1 block
6.	Happy Kids Day Care	7:05 p.m.	7:09 p.m.	Pick up kids	car	4 blocks
7.	Home	7:14 p.m.	7:22 p.m.	Return home	car	1 mile
8.						
9.						
10.						

Please remember, a trip is whenever you go from one address to another.  
 Have this travel diary by the phone when the interviewer calls. You do not need to mail the diary back to us. Thanks!

# ENCUESTA NACIONAL DE TRANSPORTE EN EL HOGAR

## Instrucciones para completar esta Hoja de Registro

- Use esta Hoja de Registro el **día asignado para anotar sus recorridos**, día que aparece al frente.
- El día asignado para anotar sus recorridos comienza a las 4:00 a.m. y finaliza a las 4:00 a.m. del día siguiente.
- Un **recorrido** quiere decir cualquier vez que usted va **de una dirección a otra**. Use una línea para anotar cada recorrido. **Incluya:**
  - Todos los recorridos que usted hizo por una razón específica, tal como ir al trabajo o a estudiar, comprar gasolina o ir a dejar a alguien a alguna parte.
  - Viajes de regreso, tal como regresar a casa de trabajar o después de ir a estudiar.
  - Caminatas a pie, correr para hacer ejercicios, salidas en bicicleta y recorridos cortos. Si usted comenzó y terminó en el mismo lugar, anote el punto más lejos al que llegó en una línea y anote en la siguiente línea el recorrido de regreso.
  - **No** incluya paradas que hizo solamente para cambiar el tipo de transportación.
  - Anote todos los recorridos de su hijo(a) por separado en una Hoja de Registro para su hijo(a), incluyendo recorridos que no fueron realizados con un miembro adulto de su hogar, tal como montarse en el autobús de la escuela.
- Si usted hizo más de diez recorridos como parte de su trabajo (por ejemplo si usted es chofer de taxi, mensajero, oficial de policía):
  - **No** anote recorridos que hizo como parte de su trabajo.
  - **Anote** recorridos que le llevó a usted hacia y desde su lugar de trabajo.
  - **Anote** todos los otros recorridos que **no eran** parte de su trabajo.
- Si usted hizo más recorridos que los que caben en la Hoja de Registro, anote el resto de sus recorridos aparte en una hoja en blanco.

### Ejemplo de recorridos hechos durante el día asignado

ENCUESTA NACIONAL DE TRANSPORTE EN EL HOGAR  
HOJA DE REGISTRO

A las 4:00 a.m. cuando comenzaba mi día asignado para registrar mis recorridos de ese día, yo estaba:  
 En casa     En algún otro lugar

¿A DONDE fue usted? (Nombre del lugar)	¿A qué HORA comenzó y terminó usted cada recorrido?		¿POR QUE fue usted allí?	¿COMO llegó usted allí?	¿Cuánta DISTANCIA anduvo usted? (cuadras o millas)
	Comenzó a las:	Llegó a las:			
EJEMPLO: West Park Theater	2:00 p.m.	2:55 p.m.	Para mirar una película	Caminé, autobús, caminé	6 millas
1. ABC Office Products	7:35 a.m.	8:43 a.m.	Para trabajar	Auto, metro, caminé	12 millas
2. New City Diner	12:05 p.m.	12:16 p.m.	Almorzar	Caminé	2 Cuadras
3. ABC Office Products	12:58 p.m.	1:10 p.m.	Para regresar al trabajo	Caminé	2 Cuadras
4. Fast Gas Mart	5:30 p.m.	6:35 p.m.	Compré gasolina para mi auto	Caminé, metro, auto	11 millas
5. Super Deal Grocery	6:42 p.m.	6:48 p.m.	Compré comida	auto	1 cuadra
6. Happy Kids Day Care	7:05 p.m.	7:09 p.m.	Recogí a niños	auto	4 Cuadras

## REMINDER

Your Travel Day is:

**Sunday, April 15**

Please use your diary to keep track of all the places you go.

## RECORDATORIO

Su día para anotar los viajes es el:

**Domingo, 15 de abril**

Por favor use su hoja de registro para anotar todos los lugares adonde usted va.

### VIAJES HECHOS AFUERA DE SU AREA

Este mapa muestra el área alrededor del lugar adonde usted vive. Cuando le llamemos por teléfono para preguntarle sobre lo que usted registró durante su día asignado, también le haremos unas pocas preguntas acerca de viajes que usted hizo a lugares afuera del círculo sombreado en el mapa, realizados durante las siguientes cuatro semanas:

**martes, 2 de abril hasta lunes, 29 de abril**

# NHTS 2001 Odometer Mileage Form

**Thank you for participating in the National Household Travel Survey.** This is the last part of the survey, and when we receive the mileage information for the vehicles in your household, you will have completed the survey.

Please record the **Current Odometer Mileage** and the **Date** you read the mileage for each household vehicle listed below. If any information shown below is incorrect, please write the changes above the incorrect entry.

Vehicle Number	Year	Make	Model	Previous Odometer Reading	Date of Previous Reading	Current Odometer Reading <small>(do not include tenths of a mile)</small>	Date of Current Reading <small>(month/day/year)</small>
01	1988	DODGE	SHADOW	169000	01/14/2002	<input type="text"/>	___ / ___ / ___

After recording the mileage and date on the form, please use any one of the following methods to send the information to us. Your reply is greatly appreciated!

- Use the enclosed postage-paid return envelope,
- Access the NHTS website at [www.nhtsmiles.org](http://www.nhtsmiles.org),

Your user ID: **13522285**  
 Your password is: **16602**

- Fax the information to NHTS-Westat toll-free at 1-888-825-8678, or
- Call the NHTS toll-free phone line at 1-888-813-7447.

# Hoja del Odómetro (Millaje) para NHTS

**Muchas gracias por participar en el Encuesta Nacional de Transporte en el Hogar.** Esta es la última parte de la encuesta. Cuando recibamos la información de millaje para los vehículos en su hogar, usted habrá completado la encuesta.

Por favor registre el **odómetro (millaje) actual** y la **fecha** en que usted leyó el millaje de cada vehículo del hogar que se adjunta a continuación: Si alguna información a continuación está incorrecta, por favor escriba los cambios arriba de lo que está incorrecto.

Número de Vehículo	Año	Marca	Modelo	Medición Original del Odómetro	Fecha original de la lectura de medición	Medición Actual del Odómetro (no incluya décimos de milla)	Fecha Actual de la lectura de Medición (mes/día/año)
01	1988	DODGE	SHADOW	169000	01/14/2002	<input type="text"/>	__ / __ / __

Después de anotar el millaje y fecha en esta hoja, por favor use cualquiera de los siguientes métodos para enviarnos la información. ¡Su respuesta será muy agradecida!

- Use el sobre de regreso que se adjunta y que ya tiene pago los gastos de correo,
- Conéctese al web de NHTS al: [www.nhtsmiles.org](http://www.nhtsmiles.org),

Su identificación de usuario es: **13522285**

Su palabra clave (password) es: **16602**

- Envíe por fax la información a NHTS-Westat al número gratis: 1-888-825-8678, o
- Llame a NHTS al número gratuito 1-888-813-7447.

National Household

Are you concerned about traffic in the State of Texas? Travel and traffic has increased everywhere. The Texas Department of Transportation (TxDOT) in cooperation with the United States Department of Transportation (US DOT) is conducting a survey, known as the National Household Travel Survey (NHTS), to better understand how people across our great state and nation travel. As part of the NHTS, TxDOT has arranged to conduct 3,500 surveys specifically in Texas. Local transportation planners will use the data collected by the surveys to update travel models as well as to evaluate transportation plans for the future.

How we use transportation systems has changed. We are interested in all of the ways that you travel from one place to another, including trips by car, bus, train, and airplane, as well as bicycle and pedestrian trips. To better assist local transportation planners in understanding daily travel and projecting future needs in your region, we are asking you to participate in the travel survey.

In about a week, a trained interviewer for the National Household Travel Survey will call and ask some questions about you and your household. Your participation is voluntary. We promise the information you give will be kept confidential and will only be used for statistical purposes.

This survey is so important for the transportation future of the State of Texas as well as our nation's transportation system that we have included a small token of our appreciation for your participation. Together, you and the other participants will help provide an accurate picture of how we travel throughout the Lone Star State.

For more information about the survey, you may visit the NHTS website, [www.bts.gov/nhts](http://www.bts.gov/nhts).

If you have questions, you may contact Tim Juarez from the Texas Department of Transportation at (512) 486-5026 or the NHTS Survey Team at 1-800-566-6262.

We would like to thank you in advance for your participation.

A handwritten signature in black ink that reads "Tim Juarez".

### PAUL FARRAGUT

Executive Director

Are you concerned about congestion? Traffic delays? Travel and traffic have increased 20 percent over the past 10 years in the Baltimore Metropolitan region. The United States Department of Transportation (US DOT) and the Baltimore Metropolitan Council (BMC) are conducting a survey, known as the National Household Travel Survey (NHTS), to better understand how people across the nation and Baltimore travel. Local transportation planners will use the collected survey data to develop transportation plans containing needed system improvements.

Use of the transportation system is constantly changing. We are interested in all of the ways that you travel from one place to another, including trips by car, bus, train, and airplane, as well as walking and bicycling trips. To better assist local transportation planners in understanding daily travel and projecting future needs, we are asking you to participate in a travel survey.

In about a week, a trained interviewer for the National Household Travel Survey will call and ask some questions about you and your household. Your participation is voluntary. We promise the information you give will be kept confidential and will only be used for statistical purposes.

This survey is so important for the future of the Baltimore region as well as our nation's transportation system that we have included a small token of our appreciation for your participation. Together, you and the other participants will help provide an accurate picture of how we travel throughout the Baltimore area.

For more information about the survey, you may visit the NHTS website, [www.bts.gov/nhts](http://www.bts.gov/nhts).

If you have questions, you may contact Charles Baber from the Baltimore Metropolitan Council at (410) 732-0500, extension 1056, or the NHTS Survey Team at 1-800-566-6262.

We would like to thank you in advance for your participation.

Sincerely,

Paul Farragut  
Executive Director  
Baltimore Metropolitan Council

IN REPLY REFER TO:

**National Household  
Travel Survey**

Dear Participating Household:

Are you concerned about traffic? Travel and traffic has increased everywhere. The United States Department of Transportation (US DOT) is conducting a survey, known as the National Household Travel Survey (NHTS), to better understand how people across the nation travel, and to evaluate plans for the future. The Hawaii Department of Transportation, as part of the NHTS, has arranged to conduct 1,500 surveys specifically for the neighbor island counties. Local transportation planners will use the data collected by the surveys to update travel models.

How we use transportation systems has changed. We are interested in all of the ways that you travel from one place to another, including trips by car, bus, train, and airplane, as well as walking and bicycling trips. To better assist local transportation planners in understanding daily travel and projecting future needs, we are asking you to participate in a travel survey.

In about a week, a trained interviewer for the National Household Travel Survey will call and ask some questions about you and your household. Your participation is voluntary. We promise the information you give will be kept confidential and will only be used for statistical purposes.

This survey is so important for the future of the Hawaii area as well as our nation's transportation system that we have included a small token of our appreciation for your participation. Together, you and the other participants will help provide an accurate picture of how we travel throughout the Hawaii area.

For more information about the survey, you may visit the NHTS website, [www.bts.gov/nhts](http://www.bts.gov/nhts).

If you have questions, you may contact Dina Lau from our Hawaii Department of Transportation at (808) 587-1845 or the NHTS Survey Team at 1-800-566-6262.

We would like to thank you in advance for your participation.

Very truly yours,

**National Household**  
Travel Survey

Dear Kentucky Traveler:

Are you concerned about the increase in traffic on Kentucky's roads? The Kentucky Transportation Cabinet, as part of a National Household Travel Survey (NHTS), is conducting 1,100 surveys specifically in your area. Local transportation planners will use the data collected by the surveys to update travel models to better understand how people travel, and to evaluate plans for the future.

How we use transportation systems has changed. We are interested in all of the ways that you travel from one place to another, including trips by car, bus, train, and airplane, as well as by foot or bicycle. To help local transportation planners understand daily travel and project future needs, we are asking you to participate in the travel survey.

In about a week, a trained interviewer for the National Household Travel Survey will call and ask some questions about you and your household. Your participation is voluntary. We promise the information you give will be kept confidential and will only be used for statistical purposes.

Because this survey is so important to the future of Kentucky, we have included a small token of our appreciation for your participation. Together, you and your neighbors will help provide an accurate picture of how we travel throughout the area.

For more information about the survey, visit the NHTS website at [www.bts.gov/nhts](http://www.bts.gov/nhts), contact Mark Pfeiffer from the Kentucky Transportation Cabinet at (502) 564-4890, or the NHTS Survey Team at 1-800-566-6262.

We would like to thank you in advance for your participation.

Sincerely,

A handwritten signature in black ink that reads 'Mark Pfeiffer'.

TIMOTHEA M. KIRCHNER  
County Administrator

TERRY L. STYER  
Chief Clerk

JOHN W. ESPENSHADE  
County Solicitor

Dear Resident:

Are you concerned about traffic? Do your trips seem to take longer than expected? Do you take more trips? To better understand how and why people travel and to evaluate the future transportation needs, the Lancaster County Planning Commission, under the direction of the Lancaster County Board of Commissioners and the United States Department of Transportation (USDOT), has arranged to conduct a household survey of residents within the County. This survey is known as the National Household Travel Survey (NHTS). The data collected by the survey will assist transportation planners in understanding how and why people travel and will help evaluate transportation plans for the future within our County.

The way people travel is changing, and we are very interested in studying the movement of people from one place to another whether it is by car, bus, train, airplane, walking, bicycle, or horse and buggy. In order to better understand daily travel and project future needs, we are asking for your help. We would like to invite you to become a part of this survey.

You probably have many questions about this survey, which is understandable. If you wish to visit the NHTS website, [www.bts.gov/nhts](http://www.bts.gov/nhts), or the Lancaster County website, [www.co.lancaster.pa.us](http://www.co.lancaster.pa.us), most of your questions will be answered. If you do not have access to the websites and you would like to speak to someone, give us a call. You can ask for the Lancaster County Planning Commission's Senior Transportation Planner, Carol K. Palmoski, at (717) 299-8333 or the NHTS Survey Team at 1-800-566-6262.

If we have answered all of your questions, then join the team. In approximately one week, a trained interviewer for the NHTS will telephone to discuss the survey with you. Your participation is strictly voluntary. The information that you will provide will be kept strictly confidential and will only be used for statistical purposes.

This survey is so important for the future of Lancaster County and the nation's transportation system that a small token has been included in this letter to show our appreciation for your effort and dedication in becoming part of this survey. By becoming part of the team, a picture of our travel patterns and a vision of future planning throughout Lancaster County will become clearer.

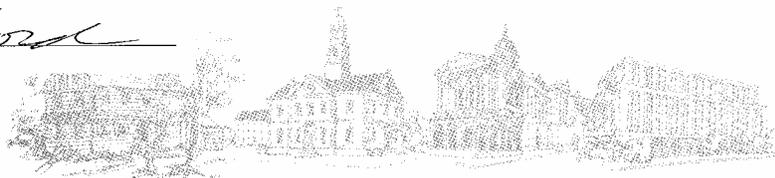

If you have any questions about this survey, please call either Carol or Susan, for your questions are very important. We would like to thank you in advance for your participation.

Sincerely,

  
PAUL THIBAUT, Chairman

National Household  
Travel Survey

Are you concerned about traffic? Travel and traffic has increased everywhere. The United States Department of Transportation (US DOT) is conducting a survey, known as the National Household Travel Survey (NHTS), to better understand how people across the nation travel and to evaluate plans for the future. The Oahu Metropolitan Planning Organization, as part of the NHTS, has arranged to conduct 1,500 surveys specifically on Oahu. Local transportation planners will use the data collected by the surveys to update travel models.

How we use transportation systems has changed. We are interested in all of the ways that you travel from one place to another, including trips by car and bus, as well as walking and bicycling trips. To better assist local transportation planners in understanding daily travel and projecting future needs, we are asking you to participate in a travel survey.

In about a week, a trained interviewer for the National Household Travel Survey will call and ask some questions about you and your household. Your participation is voluntary. We promise the information you give will be kept confidential and will only be used for statistical purposes.

This survey is so important for the future of Oahu as well as our nation's transportation system that we have included \$2.00 as a small token of our appreciation for your participation. Together, you and the other participants will help provide an accurate picture of how we travel throughout the Oahu area.

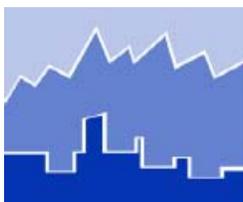

For more information about the survey, you may visit the NHTS website, [www.bts.gov/nhts](http://www.bts.gov/nhts).

If you have questions, you may contact Laureen Brennan from the Oahu Metropolitan Planning Organization at (808) 587-2015 or the NHTS Survey Team at 1-800-566-6262.

We would like to thank you in advance for your participation.

A handwritten signature in black ink that reads "Gordon Lum".

Gordon Lum  
Executive Director  
Oahu Metropolitan Planning Organization

## National Household Travel Survey

Dear «MAILATTN»:

**Thank You!** On behalf of the U.S. Department of Transportation, I thank you and the members of your household for taking part in the *National Household Travel Survey*.

As we explained in our recent telephone call, this packet provides everything your household will need to record your travel for our interview.

- A travel diary for each household member with instructions and an example on the back.
- A card reminding you of the assigned travel day. *Please put it where everyone can see it, such as on your refrigerator.*
- A brochure telling you more about the study.

Please record all trips that you and each member of your household take on your assigned travel day. **We ask each member to complete his or her own diary whenever possible.** Even if your travel on that day is not typical, we still want to know about it. If you are uncertain about whether to include a trip, go ahead and record it.

After your assigned travel day, we will call you to ask some additional questions about transportation. We would like to talk to each person age 16 or older individually, but ask that an adult respond for younger household members.

The information you give us will be held confidential, nothing will be shared that could identify you or your household. We really appreciate your participation—it is extremely important for planning for future transportation.

If you have any questions, you may contact the survey team toll-free at 1-800-566-6262 or by e-mail at [SurveyHelp@morpace.com](mailto:SurveyHelp@morpace.com). Thank you once again for participating in the survey.

Sincerely,

Susan Liss  
U.S. Department of Transportation

# NATIONAL HOUSEHOLD TRAVEL SURVEY

## TRAVEL DIARY

**At the beginning of my travel day (4:00 a.m.) I was:**  
 Home     Some other place

WHERE did you go? (Name of place)	What was the LOCATION?			What TIME did you start and end each trip?		HOW did you travel?	How FAR was it? (blocks or miles)
	ADDRESS	INTERSECTION	TYPE OF PLACE OR BUSINESS	Started at:	Arrived at:		
<b>EXAMPLE:</b> West Park	2900 Main St. Southfield, MI 48031	Main St. & Evergreen Rd.	Shopping Mall	2:00 pm	2:55 pm	Walk, bus, walk	6 miles
1.							
2.							
3.							
4.							
5.							
6.							
7.							
8.							
9.							

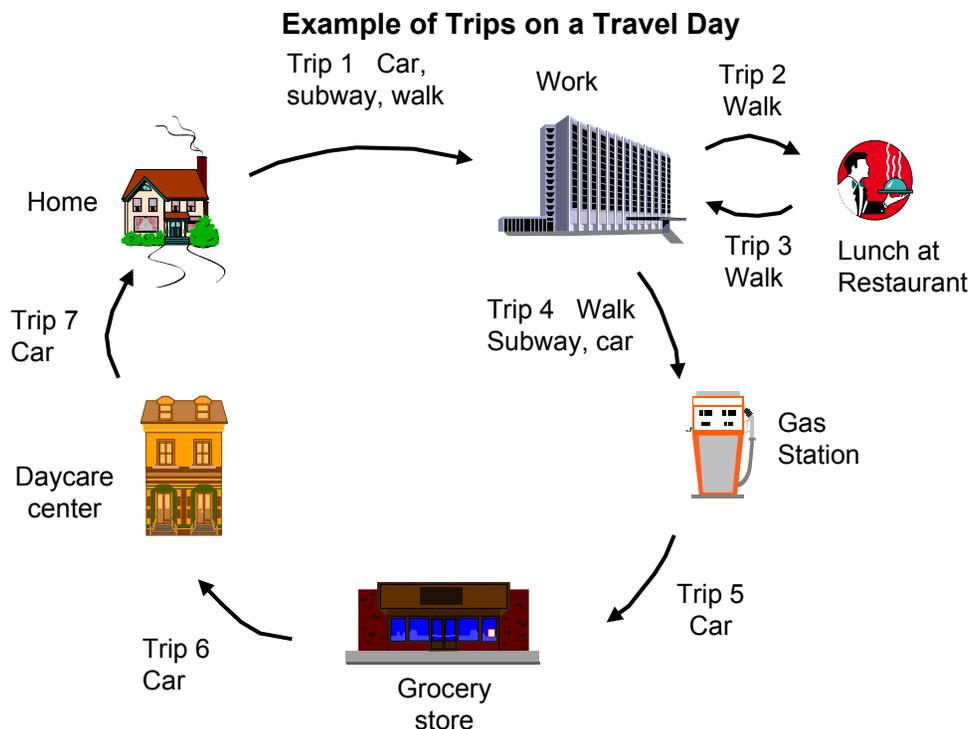

**Please remember, a trip is whenever you go from one address to another.**

N-36

Have this diary by the phone when the interviewer calls. You do not need to mail it back to us. Thanks!

## NATIONAL HOUSEHOLD TRAVEL SURVEY Instructions for Completing the Travel Diary

- Use this diary on your **assigned travel day**, shown on the front.
- The travel day starts at 4:00 a.m. and ends at 4:00 a.m. the next day.
- A **trip** is whenever you travel **from one address to another**. Use one line to record each trip. **Include:**
  - All trips you made for a specific reason, such as to go to work or school, buy gas, or drop someone off.
  - Return trips, such as coming home from work or school.
  - Walks, jogs, bike rides, and short drives. If you started and ended in the same place, list the farthest point you reached and record a return trip.
  - **Do not** include stops just to change the type of transportation.
  - Record all of your child's trips on the child's diary, including the trips that were not taken with an adult member of your household, such as riding the school bus.
- For each trip, fill in the **street address, nearest intersection, and type of place or business**. Please give as much detail as you can.
- If you made **more than ten trips as part of your job** (examples: a cab driver, delivery person, police officer):
  - **Don't** record the trips that were made as part of your job.
  - **Do** record the trips that got you to and from your work place.
  - **Do** record all other trips that **were not** part of your job.
- If you made more trips than will fit on the diary, record the rest on a blank sheet of paper.

6.							
7.							
8.							
9.							

# ENCUESTA NACIONAL DE TRANSPORTE EN EL HOGAR

## Instrucciones para completar esta Hoja de Registro

- Use esta Hoja de Registro el **día asignado para anotar sus recorridos**, día que aparece al frente.
- El día asignado para anotar sus recorridos comienza las 4:00 a.m. y finaliza a las 4:00 a.m. del día siguiente.
- Un **recorrido** quiere decir cualquier vez que usted va **de una dirección a otra**. Use una línea para anotar cada recorrido. **Incluya:**
  - Todos los recorridos que usted hizo por una razón específica, tal como ir al trabajo o a estudiar, comprar gasolina o ir a dejar a alguien a alguna parte.
  - Viajes de regreso, tal como regresar a casa después de trabajar o después de ir a estudiar.
  - Caminatas a pie, correr para hacer ejercicios, salidas en bicicleta y recorridos cortos. Si usted comenzó y terminó en el mismo lugar, anote el punto más lejos al que llegó en una línea y anote en la siguiente línea el recorrido de regreso.
  - **No** incluya paradas que hizo solamente para cambiar el tipo de transportación.
  - Anote todos los recorridos de su hijo(a) por separado en una Hoja de Registro para su hijo(a), incluyendo recorridos que no fueron realizados con un miembro adulto de su hogar, tal como montarse en el autobús de la escuela.
- Para cada recorrido, anote **la dirección por calle, la intersección más cercana y otra señal cercana a la dirección**. Por favor anote tanto detalle como usted pueda.
- Si usted hizo más de **diez recorridos** como **parte de su trabajo** (por ejemplo si usted es chofer de taxi, mensajero, oficial de policía):
  - **No** anote los recorridos que hizo como parte de su trabajo.
  - **Anote** recorridos que le llevó a usted hacia y desde su lugar de trabajo.
  - **Anote** todos los otros recorridos que **no eran** parte de su trabajo.
- Si usted hizo más recorridos que los que caben en la Hoja de Registro, anote el resto de sus recorridos aparte en una hoja en blanco.

### Ejemplo de recorridos hechos durante el día asignado

ENCUESTA NACIONAL DE TRANSPORTE EN EL HOGAR HOJA DE REGISTRO							
A las 4:00 a.m. cuando comenzaba mi día asignado para registrar mis recorridos de ese día, yo estaba:							
<input type="checkbox"/> En casa <input type="checkbox"/> En algún otro lugar							
¿A DONDE fue usted? (Nombre del lugar)	¿Cuál fue la LOCALIZACION de ese lugar?			¿A qué HORA comenzó y terminó usted cada recorrido?		¿COMO llegó usted allí?	¿Cuánta DISTANCIA anduvo usted? (cuadras o millas)
	DIRECCION	INTERSECCION	TIPO DE LUGAR O NEGOCIO	Comenzó a las	Llegó a las		
EXAMPLE: West Park	2900 Main St. Southfield, MI 48031	Main St. & Evergreen Rd.	Centro comercial	2:00 pm	2:55 pm	Caminé, autobús, caminé.	6 millas
1. ABC	123 Polk St. Chicago, IL 60602	Polk St. & State St.	Tienda de artículos de oficina	7:35 a.m.	8:43 a.m.	Automóvil, Metro, Caminé	12 millas
2. New City Diner	1220 Wabash St. Chicago, IL 60602	9 <sup>th</sup> St. & Wabash St.	Restaurante	12:04 p.m.	12:16 p.m.	Caminé	2 cuadras
3. ABC	123 Polk St. Chicago, IL 60602	Polk St. & State St.	Tienda de artículos de oficina	12:58 p.m.	1:30 p.m.	Caminé	2 cuadras
4. Fast Gas	3437 Stone Park Rd. Melrose Park, IL 60571	Stone Park Rd. & Chicago Ave.	Estación de gasolina	5:50 p.m.	6:35 p.m.	Caminé, Metro, Automóvil	11 millas
5. Super Deal	3560 Stone Park Rd. Melrose Park, IL 60571	Stone Park Rd. & 35 <sup>th</sup> St.	Supermercado	6:42 p.m.	6:48 p.m.	Automóvil	1 cuadra
6. Happy Kids	1832 Wolf Rd. Northlake, IL 60575	Wolf Rd. & Franklin Ave.	Guardería	7:05 p.m.	7:09 p.m.	Automóvil	4 cuadras
7. Home	279 Fair Oaks Rd. South Plainfield, IL 60521	Fair Oaks Rd. & Ridge Rd.	Residencia	7:14 p.m.	7:22 p.m.	Automóvil	1 milla
8.							
9.							

1) Por favor recuerde, un recorrido es cuando usted va de una dirección a otra.  
2) Tenga esta Hoja de Registro a mano, cerca del teléfono lista para cuando llame el entrevistador.

## **APPENDIX O**

### **COMPARABILITY WITH EARLIER NPTS SURVEYS**

Exhibit 1-1 in Section 1-D provides summary information on the NPTS surveys that were conducted between 1969 and 2001. This Appendix provides additional detail on each of these surveys.

#### **1969 NPTS**

The original NPTS was conducted from 1969 to 1970 by the U.S. Bureau of the Census, which collected the survey data for the Federal Highway Administration (FHWA) of the U.S. Department of Transportation. That first NPTS survey was based on a multi-state probability sample of housing units located in 235 sample areas, which included 485 counties and independent cities representing every state of the U.S. and the District of Columbia. Experienced Census Bureau field staff conducted personal interviews in some 15,000 households, obtaining transportation-related information for all occupants.

Sections of that initial questionnaire provided information including:

- automobile record (ownership, whether an automobile was purchased new or used, and annual miles driven),
- proximity to public transportation and shopping,
- travel to work,
- driver information, such as estimated annual miles driven by licensed drivers,
- travel to school,
- all one-way trips by motor vehicle or some form of public transportation during the previous 24 hours (referred to as the travel day), and

- record of all trips lasting one or more nights during the seven days that ended the day before the pre-assigned travel day.

### **1977 NPTS**

During the 1977 NPTS, an update of the 1969 nationwide survey, the data were again collected from households in a national sample of area segments, with basically the same sampling, collection, and processing procedures as the 1969 version. The Census Bureau collected the data from approximately 18,000 households nationwide. The 1977 survey questionnaires were expanded considerably and updated to better address then-current issues, and the survey procedures were modified to upgrade the effort.

One of the major differences between the 1969 and the 1977 surveys was the extension of vehicle coverage to all motor vehicles owned by a sample household. While the 1969 survey included only automobiles as part of the vehicle record, the 1977 survey also included personal trucks and vans, camper vehicles, motorcycles, and mopeds.

### **1983 NPTS**

When the 1983 NPTS was conducted between February 1983 and January 1984, the Census Bureau again collected survey data by using face-to-face interviews in an area probability sample of nearly 6,500 households. Additional, information was obtained about the use of safety devices in household vehicles including seat belt usage: when, how often, under what conditions; and information about child safety topics such as type of safety seat used and its position in the vehicle, internal harnesses in use, and injuries sustained from an emergency stop when a child was not using a child safety seat or other safety device.

## 1990 NPTS

Research Triangle Institute (RTI) conducted the 1990 NPTS using a computer-assisted telephone interviewing (CATI) technology. This was a significant change from the in-home interview methodology previously used for the NPTS. The national sample consisted of 18,000 households. One state and two Metropolitan Planning Organizations purchased additional interviews in their areas, increasing the total sample to more than 22,000 households.

Other methodology changes in 1990 were:

- the use of the random-digit dialing (RDD) sampling procedures,
- greater utilization of proxy respondents, and
- an increase in the allowable window for interviewing sampled persons about their travel from four to six days.

The 1990 NPTS included new questions about vehicle accidents that members of the household had experienced and the highway types used for selected vehicle trips on the household's travel day. The core data components, however, were comparable to previous surveys in the series.

The 1990 NPTS features which were the same as in previous NPTS surveys included the:

- definitions of eligible persons, trip purposes, and modes of transportation,
- concepts of a travel-day section for all trips taken on the travel day and a travel period section for reporting long trips taken during a 14-day period, and
- core information collected for sample households, persons, vehicles, drivers, travel period, and travel day trips. For each travel day trip, information was collected regarding the trip purpose, mode, distance, time taken, and accompanying persons, as it was during earlier surveys.

## **1995 METHODS RESEARCH**

Prior to the 1995 NPTS pretest, the following methodology issues, which could improve the 1995 survey results or strengthen analysis capability, were studied:

- methods to obtain more complete trip reporting,
- alternate definitions of a completed household interview,
- use of proxy respondents,
- obtaining data on trip chaining,
- enhanced geographic coding of household and work locations,
- expanded on-line editing during the interviews, and
- vehicle odometer readings to obtain more accurate vehicle miles traveled (VMT) estimates.

## **1995 PRETEST**

In preparation for the 1995 NPTS, a large methodological pretest was conducted from November 1994 through January 1995 to identify problems with new questions, determine the average interview time, and test the data collection procedures. A methodological experiment was embedded within the pretest sample in order to test three different survey methods: recall, memory jogger, and travel diary. The major pretest result was the indication that the use of travel diaries would lead to more complete NPTS trip reporting, and FHWA decided to utilize a one-day trip diary in the 1995 NPTS.

Other pretest results included the following:

- practicality of mailing advance letters to selected households,

- feasibility of collecting more detailed information about the household location,
- feasibility of collecting paired odometer readings for the sample vehicles, and
- advantage of using a household roster of trips to reduce respondent burden and increase trip recall.

The household roster of trips allowed the CATI interviewer to skip trip detail for a specific respondent if another household member had already reported information about that trip.

Mailing advance letters informed the sample households of their selection for the 1995 NTPS, legitimized the survey and presented it in the larger context, and notified them that an interviewer would telephone their household to interview the members.

### **1995 NEW CONTENT**

Research Triangle Institute (RTI) conducted the 1995 NPTS. The survey included new questions to:

- measure the public's perceptions of, or satisfaction with, the nation's transportation system,
- determine respondents usual modes of travel,
- elicit their reactions to statements about mobility and congestion,
- identify perceived difficulties in travel,
- collect information on the use of seat belts,
- describe the household's location, type of structure, and tenure, and
- improve trip purpose coding.

## **2001 NHTS**

## **2000 PRETEST**

From February through May 2000, FHWA and BTS funded a pretest of the 2001 NHTS. This pretest was conducted jointly by RTI and Westat. One of the key objectives of the pretest was to determine whether the Nationwide Personal Transportation Survey (NPTS) (focus on daily travel) should be combined with the American Travel Survey (ATS) (focus on long-distance travel). Both survey instruments were redesigned to better suit the objectives of the 2000 data collection effort. Other objectives included:

- improving the content of the questionnaires to avoid duplication between the two surveys and improve trip data,
- study the use of incentives at different stages during data collection,
- study the differences in trip data quality with and without the use of travel period diaries,
- study different data collection modes,
- study different questionnaire sequencing--administer the NPTS prior to the ATS and vice versa, and
- determine the study design that was the most cost-effective while maximizing response rates.

Eight different study designs were examined. These are presented in Exhibit O-1.

## Exhibit O-1. 2000 NHTS Pretest Designs

Design Number	Design Name	Sample Type	Data Collection Mode	Type of Incentive
1	NPTS only	List-assisted RDD	CATI	No incentive
2	NPTS only	List-assisted RDD	CATI	\$2 cash per household with travel diaries
3	NPTS only	List-assisted RDD	CATI	\$5 cash per household with advance letter and \$10 per household with travel diaries
4	ATS only	List-assisted RDD	CATI	\$2 cash per household member with travel diaries
5	NPTS and ATS (retrospectively)	List-assisted RDD	CATI	\$2 cash per household member with travel diaries
6	NPTS and ATS	List-assisted RDD	CATI	\$2 cash per household member with travel diaries
7	ATS and NPTS	List-assisted RDD	CATI	\$2 cash per household member with travel diaries
8	NPTS and ATS (retrospectively)	Address-based sample	CATI and In-Person	\$5 cash per household with advance letter and \$2 per household member with travel diaries

### 2001 NHTS DESIGN

The findings of the 2000 pretest resulted in the 2001 NHTS being a combined survey. Pretest Design 5 (see Exhibit O-1) was the study design selected. Key modifications to the 1995 NPTS included:

- the assignment of a four-week travel period and the collection of trip data on all long-distance round trips of 50 miles or more from home,

- the collection of travel day and travel period data from all household members, not just household members 5 years and older,
- requesting a proxy for all household members less than 16 years. Household members age 14 and 15 could respond for themselves if approval was obtained from an adult household member. In 1995, proxy interviews were required of household members age 13 and below,
- modifying the definition of a travel day trip to exclude stops to change type of transportation,
- obtaining more detail on trip purposes,
- using a cash incentive in the pre-household interview mailing, and
- making additional modes available to collect odometer readings (Internet, facsimile and a toll-free number).

## APPENDIX P

### DATA EDITING

Section 3-D discusses data editing implemented in the conduct of the 2001 NHTS. The following is a list of the edits that Westat ran on the national, New York and Wisconsin CATI database. After the edits were run cases that failed the edit were manually examined to determine if the value provided by the respondent was a likely response. If it was, the value was left unchanged even if it failed the edit. However, if the value was highly unlikely it was set to a not ascertained response (a code of -9). If the value was set to something other than -9, edit or imputation flags were set to indicate items that were modified.

#### Vehicle:

1. The number of years each vehicle is owned (L8) will be compared to the model year of the vehicle (B2).
2. The number of years each vehicle is owned must be equal to or less than the difference between interview year and the model year plus 1.
3. When both odometer readings have been obtained, compute the annualized mileage and compare it to the mileage in L9/L10.
4. Review cases where L9/L10 is 0 miles and the vehicle was used on travel day (G31).
5. Review cases where G30 is 1 on any trip and the count of vehicles in B2 is 0.
6. Review cases where the vehicle ID in G31 does not exist in B2.

#### Worker:

7. Compare worker status between the screener and extended. Review cases where C8=1 and E3 is not 1 or 2, E4 is not 1 or E5 is not 1, 2 or 3 and vice versa.
8. Review cases where age in C8 < 14 years and E3 is 1 or 2, E4 is 1, or E5 is 1, 2 or 3.
9. Review cases where the person is not a worker based on the screener (C8) but they took trips to work. That is G25 or G26 on any trip is 11 or 12.

10. Review cases where E5 is not 3 or E6 is not 1 (the person does not have multiple jobs) and there is more than one work trip (G25 or G26 is 11 on more than one trip).

Driver:

11. Check if the screener (C8) says the person is not a driver but the person drives on the job (E8 is 1), drove on travel day (G49 has enum of person), driver flag has been set for person (G49), or person drove on travel period trip (I7 has enum of person).

12. Check for cases where the person is a driver (C8) and also < 14 years old (C8).

13. Check for persons that are <15 and E8 is 1, or G49 or I7 has persons enum.

14. Review cases where L5 is > 200,000 miles.

15. Review cases where L9 is > 200,000 miles.

16. Use L8 to annualize L10 and provide cases where the mileage is > 200,000 miles.

17. Number of persons where L5 = 0 (did not drive in last 12 months) and E8 =1 (drives on job) or G49 or I7 have the persons enum number (the person drove on travel day or travel period).

18. Number of persons where L5 = 0 (did not drive in last 12 months), C12 indicates they are the primary driver on a vehicle and L9/L10 shows the vehicle was driven in the past 12 months.

Household Enumeration:

19. Review cases where the screener respondent or reference person is < 16 years.

20. Review cases where the household member is <16 and his/her relationship to the reference person is spouse (C8).

21. Review cases where the screener respondent and reference person are different.

22. Review cases where G45 or I3 are 99. Will need to verify if this person was a household member on date of screener.

Survey Parameters:

23. Review cases where age is < 14 (C8) and the extended was not completed by proxy (E1 = 1).

24. Review cases where E1=1 and result code is CP and E1=2 and result code is CS.
25. Review cases where the interview date for a household member is more than six days after the travel date.
26. Review cases where the interview date is > 16 days after the travel date.
27. Check file to make sure the day of week and travel day match.

Travel Day:

28. Review cases where E14 is 998 (this was a code on the pretest for this question but not on the main study.)
29. Review cases where F567CHK = 1 (the distance/time/mode check for work failed but the R did not alter his/her response).
30. For cases where F567CHK = 2, conduct the check in programmer box after E16 in the 6/29<sup>th</sup> version of the questionnaire (verify if this box matches CATI and let me know if it does not) to see if the person would have failed the check a 2<sup>nd</sup> time. If yes, review those cases.
31. For cases that are not missed trips, review cases where the start time on a subsequent trip (G16) is < the end time on a previous trip (G17) for at least one trip.
32. Provide the number of cases where G13 is 1 (took no trips) and the trip count is not 0 (G12).
33. Provide the number of cases where G9 is 1 or G10 is 1 and the trip count is not 0 (G12).
34. For trips where G44 = 1 (household members on trip), review the cases where G25 or G26 and G27 have a code of 21 (both persons went to school as a student).
35. For trips where G44 = 1 (household members on trip), review the cases where G25 or G26 and G27 have a code of 11 (both household members went to work).
36. Review cases where G19 = 1 (took public transportation on travel day) and G34 is not 10, 11, 16, 17, 18 or 20 on any trip (did not report using public transportation on any trip).
37. Review cases where G33 is 1 and G34 is not 10 or 11 on any trip.
38. Review cases where G33 is 2 and G34 is not 16, 17, or 18 on any trip.

39. Review cases where G33 is 3 and G34 is not 20 on any trip.
40. Review cases where the sum of the time in G36, G37 and G39 is > than the time in G42 for any trip.
41. Review cases where G40 is 996, 997 or 998.
42. Provide the number of cases where G29CHK = 1 (the distance/time/mode check for G34, G40 and G42 failed but the R did not alter his/her response).
43. For cases where G29CHK = 2, conduct the check in programmer box after G42 in the 6/29<sup>th</sup> version of the questionnaire (verify if this box matches CATI and let me know if it does not) to see if the person would have failed the check a 2<sup>nd</sup> time. If yes, review those cases.

Travel Period:

44. For H1, I9, I10, J1 and K4. Need to split the city field into a city and country field for international trips. Initially, do this only where the state is ZZ. Once geocoding is complete, provide trips where the state was not ZZ but should have been so that these trips can be added to the file e.g., CA for Canada.
45. For each trip, provide cases where the return date is before the departure date (in H1).
46. Review cases where the return date for a trip is not between the start and end date of the travel period (in H1).
47. Sort trips by start date (H1). Provide cases where the start date for any trip, excluding the current trip, is contained in another trip.
48. Review cases where the departure and return date are not the same (the subject did not leave and return on the same day) and there is another travel day trip for the subject that has the same departure and return date, city and state (H1). The edit is designed to capture duplicate travel period trips. We are excluding trips where the departure and return dates are the same as it is possible to make multiple long trips on the same day to the same place.
49. Review cases where RECURR is 1 and NTIMES is not > 1.
50. Review cases where the number of recurring trips provided is not possible within the travel period. This can be calculated by: 1) Calculating the difference between the return date and the departure date of the trip, 2) Multiplying the number in 1) by

NTIMES, 3) Calculating the number of days between the end of the travel period and the departure date, and 4) If the number in 2 is more than the number in 3 then NTIMES should be made -9 (not ascertained). Otherwise NTIMES should be left unchanged.

51. Provide a crosstab of number of recurring trips (NTIMES) by trip purpose (I13).
52. Check ranges around the number of non-HHMs on each trip. Provide cases where: I5 is 1, 11, 17, 21, 24 or 26 and I4 is not 1 to 5. I5 is 2, 3, 6, 18 or 20 and I4 is not 1 to 10. I5 is 4 or 5 and I4 is not 1 to 3. I5 is 7 or 25 and I4 is not 1 to 2. I5 is 8, 9, 10, 12, 13, 14, 15, 16, or 19 and I4 is not 1 to 100. I5 is 22 or 23 and I4 is not 1 to 4.
53. Review cases where I5 is 14 and I8 is 8 or 9 (airplane is access to an intercity bus).
54. Review cases where the state for I9 is ZZ.
55. Verify that when the MRT flag is set, we have just one trip.
56. If K1 is 99, Review cases with travel day trips of 42 miles or more.
57. Review cases where I15 is 15 or 16 and K6 is not -1.
58. Review cases where K6 is 99 and on any travel day trip G40 is >41 miles and G34 is 15 or 16.

Other:

59. Review cases where M6d is 1 (this subject has given up driving) and the same subject drove on a travel day or on a travel period trip (G48 (HHMEMDRV) or I7 (HHMDRV has the person number of the subject).
60. If L11 is 5, Review cases where G32 is 1 on any trip.
61. Review cases where current year less M10 is more than the age of the respondent in C8

## **APPENDIX Q**

### **TRACT AND BLOCK GROUP VARIABLES**

#### **WHY ADD THESE VARIABLES**

These variables were added to describe the characteristics of the areas where the NHTS survey respondents live. This allows the data analyst to look for patterns in travel behavior, not only by individual characteristics, but by neighborhood characteristics. The data user can examine how characteristics such as population density, housing density, renter occupancy rate, and urbanicity of the household location may affect individual travel behavior.

#### **TYPICAL NHTS HOUSEHOLD**

For example, the respondents from our typical NHTS household, Amy and Keith, live in a townhouse in the suburbs of a metropolitan area. The neighborhood that they live in (at the block group level) is a mix of detached homes and townhouses and apartments. There are approximately 2,500 housing units per square mile in their neighborhood. Is their travel more like people who live in medium-density mixed housing in other neighborhoods, or is their travel more like other people who live in lower-density single family detached houses in their neighborhood or other neighborhoods like it? The tract and block group variables allow an examination of these similarities and differences.

#### **SOURCE OF TRACT AND BLOCK GROUP DATA**

The data contained in these variables was derived from 2000 Census data and estimated forward to 2001 by Claritas, Inc. An annual demographic update is developed by this company to serve as a source of estimates of population, household, and housing unit characteristics. These estimates are made at relatively small units of geography, such as census tracts and block groups, which make this update effective for use in supplementing the NHTS data. The update is a comprehensive process that relies on a number of data sources, including regional and city planning agencies, federal agencies ( e.g., Bureau of Labor Statistics, Bureau of Census, Bureau of Economic Analysis) U.S. Postal Service, the direct mail industry, the real estate industry, and experts in the fields of geographic information systems and mapmaking.

## **VARIABLE NAMING SCHEME**

The variable names were designed so that:

- many of these variables would fall together in an alphabetic listing, and
- the variable name would help in describing the contents.

The naming scheme is:

First letter - H for household descriptor

Second letter - B for block group level data  
T for tract level data

Third letter of  
Household variables - H for housing characteristic  
P for population characteristic.

For example, HTHRESDN is a household descriptor, at the tract level, describing a housing characteristic, specifically, residential density (RESDN).

The last 5 letters of the variable describe the data in the variable, e.g. POPDN = population density.

The set of tract and block group variables derived by Claritas are:

### **HOUSEHOLD DESCRIPTOR, BLOCK GROUP LEVEL**

HBHRESDN - housing units per square mile  
HBHTNRNT - percent renter-occupied housing  
HBHUR - urban/rural code (see below)  
HBPPOPDN - population density (persons per square mile)

### **HOUSEHOLD DESCRIPTOR, TRACT LEVEL**

These are the same as the Block Group variables, but a "T" (tract) replaces the "B" (block group) in the second letter of the variable name. There is one additional household descriptor variable at the tract level that is related to the amount of employment in the residence census tract:

HTEEMP DN - jobs per square mile

This was added to give a picture of the degree of business activity at the residence end.

## URBAN- RURAL CONTINUUM

The remainder of the Appendix describes the urban/rural continuum developed by Claritas, Inc. These variables:

HTHUR: Urban/rural code, census tract

HBHUR: Urban/rural code, block group

should not be confused with the variable URBAN, which is the urbanized area status of the sample household.

The categories of the Urban/Rural Continuum, and the distribution of NHTS households within these categories, are presented in the following two tables. The first table shows the distribution of the weighted sample, which estimates the national distribution of households across the urban/rural continuum. The second table presents the distribution of the unweighted (raw) NHTS sample, which represents only the distribution of the respondent households.

### Urban/Rural Continuum - Distribution of Weighted NHTS Sample

	Households in NHTS block group level	Percent of households block	Households in NHTS tract level	Percent of households tract level
Urban	17,570,985	16.37	17,707,284	16.49
Second City	20,965,824	19.53	20,147,106	18.76
Suburb	25,206,250	23.48	25,796,958	24.03
Town	22,554,918	21.01	22,463,661	20.92
Rural	21,022,205	19.58	21,205,173	19.75
Subtotal	107,320,182	99.96	107,320,182	99.96
Not Ascertained	45,163	0.04	45,163	0.04
Total	107,365,345	100.0%	107,365,345	100.0%

### Urban/Rural Continuum - Distribution of Unweighted NHTS Sample

	Households in NHTS <b>block group level</b>	Percent of households <b>block</b>	Households in NHTS <b>tract level</b>	Percent of households <b>tract level</b>
Urban	7,809	11.18	7,861	11.26
Second City	14,836	21.25	14,416	20.65
Suburb	14,260	20.42	14,632	20.96
Town	17,258	24.72	17,307	24.79
Rural	15,630	22.39	15,577	22.31
Subtotal	69,793	99.97	69,793	99.97
Not Ascertained	24	0.03	24	0.03
Total	69,817	100.0%	69,817	100.0%

## BACKGROUND OF URBAN-RURAL

Claritas, Inc. developed an urban-rural dimension to incorporate into their lifestyle cluster system, which is used primarily for research and marketing applications. The goal was to establish objective classifications that were less boundary-dependent than previous topologies.

## URBAN- RURAL VARIABLE

The classification that is reflected in the Urban/Rural variable is based on population density, but not just the density of a specific geography, but the density in context of its surrounding area, or “contextual density”. To establish this classification, the United States was divided into a grid to reduce the impact of variation in size (land area) of census tracts and block groups. Density was converted into centiles, that is, the raw numbers (persons per square mile) were translated into a scale from 0 to 99.

“Rural” (centiles 19 and less) and “small town” (centiles 20 to 39) definitions are based solely on the density. Population centers were defined if a route through the 8 neighboring cells could be constructed in which the density of successive cells was decreasing or equal. Population centers with centiles greater than 79 were designated “urban.” Other centers were classified as “second cities.” Finally, “suburban” areas of the population centers were defined, using both the cell density and the cell’s density relative to the population center’s density.
